Welcome to the UHFSDR Group. This is for discussing my UHFSDR transceiver board.
I just ran out of parts for the mini-kits and have ordered more. Digikey is fast(2 or 3 days), Minicircuits and Coilcraft are slower - 7 to 14 days.
Also, all my in stock boards are spoken for. Just ordered another 100. That takes about 2 weeks for production and delivery.

I'm quite happy to see that there is that much interest in the project that you can order another 100 boards! Another fun toy to work hard to get done "on the side". :O)

There is also the SDR-widget.

http://www.yoyodyneconsulting.ca/pages/SDR-Widget-lite.html

I've been thinking that combining that and a UHFSDR might be interesting as the SDR-Widget provides some control lines for managing the SIS570 and stuff but it's not cheap.

Grant.

16. Are additional RF filters needed?

Yahoo group: UHFSDR
Date: 2011-01-14 09:51:52 UTC
From: Rob
Topic: 16 Message: 16

Hi,

I've had a look through the uhfsdr operation doc and thought I had understood how it works(!). So I didn't understand the need for additional external filters that was discussed on the softrock group.

I apologise if this is obvious to everyone except me but could you please explain?

Thanks
Rob

http://groups.yahoo.com/group/softrock40/message/51079

Re: [softrock40] Re: UHFSDR Full Kits

Siven:
True. The UHFSDR does not include filters. You will need band pass filters for receive. For transmit, you will need either band pass filters or low pass filters.

Rob:
On receive, DBM's will respond to odd harmonics of the LO. If you have no strong signals on those frequencies, you can get away without the band pass filter on receive. On transmit, there will also be some odd harmonic energy present. In order to comply with the FCC requirements, you will need the low pass filters on the RF output.

18. mixer output and diplexer

Yahoo group: UHFSDR
Date: 2011-01-14 11:52:11 UTC
From: marcolanie
Topic: 18 Message: 18

Hi
YASQ : yet another stupid question :
as stated in the operation manual : "The desired IF outputs are from DC to the sound card sampling frequency..."

so far, so good
but

"Following the 6dB pad is a diplexer with a 50KHz cut-off"// with "a near 50 ohm path to ground for all signals above 50 Khz" and another cell of the diplexer that "pass all signals below 50 Khz to the following low noise audio amp".

now the stupid question : why 50 KHz (and not something slightly over 192KHz), or did I mix two different ideas concerning the value of the "IF" and the bandwidth of the audio processor ?

Marc

Assuming 192KHz sound card sampling, then each phase (I and Q) should be
cut-off at somewhere
below 96KHz, in order not to get aliasing. But most "garden variety"
sound cards are 96KHz, so
you want to cut off somewhere around 48KHz.

20. LO and phase-splitter

Yahoo group: UHFSDR
Date: 2011-01-14 13:17:21 UTC
From: Marcus D. Leech
Topic: 20 Message: 20

So, the LO on the UHFSDR operates at twice the desired frequency, and goes into a phase-splitter
based on a pair of D flops. So I have two questions:

o How does the phase splitter produce 90-degree phasing
o The result is a square-wave, not a sinusoid, so don't you end up with odd harmonics in the
output spectrum of the the mixers?

Cheers
Marcus

That should say the desired IF outputs are from DC to plus and minus 1/2 the sound card sampling frequency. The 50 KHz cutoff was chosen for a 96 KHz sampling frequency. If using 192 KHz, then the cut-off should be about 100 KHz.

From: Dave - WB6DHW
Topic: 20 Message: 23

Marcus:
Both the Q and Qnot outputs (they are 180 degrees apart) of the Si570 are used. When divided by 2, they become 90 degrees apart since the time from the Q divided by 2 going high and the Q not divided by 2 going high stays the same and the frequency is 1/2, then the phase difference is also divided by 2. DBM's produce odd harmonics even if driven by a sine wave. DBM's are a little more efficient if the LO is driven by a square wave.

This may be controversial and it might simply a problem at this end but I am somewhat wary of using the Si570 at UHF.

Recently, I completed a Softrock for 10 MHz being driven by a QRP2000 instead of the crystal. I set the QRP2000 which uses a Si570 to 42.72 MHz. My intention was to use the Softrock/QRP2000 combination to pick up the IF of my TS2000X (10.695 MHz centre). I want to have a panoramic adapter for 1296 MHz. Whilst experimenting with that combination before going inside the TS2000X I discovered that the Si570 was blocking the internet access of my PC which is wifi attached to a router about 3 metres away. I believe that the wifi is on about 2.4 GHz so my assumption is that the Si570 is producing a pretty big signal somewhere near 2.4 GHz. This doesn't seem a good recipe for success when looking for very weak signals at UHF and above.

Maybe it is a problem my end but I have now reverted to using the Softrock alone and have now obtained crystals which will give me 10.680 MHz without the Si570.

Comments would be welcomed.

Neil, G3RIR

Is your softrock in a shielded case ??

I find it wild that a Lo of 10mhz would have enough power to jam a wireless router at 10Ft away ...
lets see 2400mhz / 42mhz, or even 10.695..... is 56th harmonic, or 224th with the 10.695.
Also i would imagine that the router is capable of changing chanels - so a change of over 1mhz or so is possible - so if it was a carrier from the Si570 a channel change should do.
or a change in Lo of the Si570 should have some effect. (im wondering if you have some Lo leak into the UHF of the TS2000 that's being Tx'd)

Mike KC7NOA --- I think my question is do'able ....

Recently, I completed a Softrock for 10 MHz being driven by a QRP2000

instead of the crystal. I set the QRP2000 which uses a Si570 to 42.72 MHz.

My intention was to use the Softrock/QRP2000 combination to pick up the IF

of my TS2000X (10.695 MHz centre). I want to have a panoramic adapter for

1296 MHz. Whilst experimenting with that combination before going inside the

TS2000X I discovered that the Si570 was blocking the internet access of my

PC which is wifi attached to a router about 3 metres away. I believe that

the wifi is on about 2.4 GHz so my assumption is that the Si570 is producing

a pretty big signal somewhere near 2.4 GHz. This doesn't seem a good recipe

for success when looking for very weak signals at UHF and above.

Maybe it is a problem my end but I have now reverted to using the Softrock

alone and have now obtained crystals which will give me 10.680 MHz without

the Si570.

Comments would be welcomed.

Mike and others.

The Softrock is not in a shielded case nor is it yet connected to the TS2000X and the TS2000X wasn't even powered. I built it into a plastic case so that I could minimise earth loops.

By experiment I proved that switching off the Softrock/QRP2000 combination the wifi connection sprung into life again. Also I found that wrapping the Softrock/QRP2000 combination in kitchen foil stopped the problem but the wifi was again blocked as soon as I removed the foil.

If indeed there are some harmonics or spurii which block the wifi signal I suspect even in a shielded case once I connect it to the TS2000X IF then there would be enough leakage to cause havoc with my ability to pick up very weak 1296 MHz signals or even worse when I get my 13cm transverter working.

I had the Si570 set to 42.72 MHz which gets divided by 4 in the QSD in the Softrock to give reception at 10.68 MHz which is deliberately just 15 kHz low of the centre of the TS2000X IF at 10.695 MHz. I hadn't got as far as connecting it the TS2000X as yet. In fact I have yet to build a buffer.

I am proceeding along the crystal path now but the QRP 2000 Si570 proved very successful as a pseudo vfo and I would like to use it in other projects but I need to get to the bottom of the wifi blocking before I can.

Is your softrock in a shielded case ??

I find it wild that a Lo of 10mhz would have enough power to jam a wireless router at 10Ft away ...
lets see 2400mhz / 42mhz, or even 10.695..... is 56th harmonic, or 224th with the 10.695.
Also i would imagine that the router is capable of changing chanels - so a change of over 1mhz or so is possible - so if it was a carrier from the Si570 a channel change should do.
or a change in Lo of the Si570 should have some effect. (im wondering if you have some Lo leak into the UHF of the TS2000 that's being Tx'd)

Sounds like a shilded case and a bandpass for 10Mhz you would be good to go!!!

Personaly I want a Si570 that had harmonics clear up to 1.2Ghz.... I want to cover the 900Mhz band too!!!! Good 120db band pass filters and mabey a notch.

I also plan on using a dipexer that has 75db band rejection - first cut at 180Mhz, second port at passes 220Mhz band and 3rd passes
every thing above 300Mhz ... but that's just me.

Mike,

I found that covering the plastic case which contains the Softrock/QRP2000 with kitchen foil cured the problem. I had used a plastic case to minimise earth loops, particularly from the antenna connection. It seems that the best route is to use a metal case and find some method of isolating the "earth" connection to the antenna connector.

For my purpose which is to provide a pan-adapter on the IF of my TS2000X, I have obtained a suitable crystal for the Softrock to give me 10.680 MHz (15kHz offset from the centre of the IF) and will use the QRP2000 for other purposes.

I have no doubt whatsoever that the combination of Softrock/QRP2000 which I built was creating sufficient RF to cause my wifi internet connection to be masked. Clearly such large signals at about 2.4GHz are not conducive to weak signal work at Microwave. It is probably my construction and not anything inherently wrong with either the Softrock or the QRP2000 as in every other respect they are superb kits and have provided me with a fantastic introduction to the world of SDR.

Re: [UHFSDR] uhf with Si570c

This may be controversial and it might simply a problem at this end but I am somewhat wary of using the Si570 at UHF.

Recently, I completed a Softrock for 10 MHz being driven by a QRP2000 instead of the crystal. I set the QRP2000 which uses a Si570 to 42.72 MHz. My intention was to use the Softrock/QRP2000 combination to pick up the IF of my TS2000X (10.695 MHz centre). I want to have a panoramic adapter for 1296 MHz. Whilst experimenting with that combination before going inside the TS2000X I discovered that the Si570 was blocking the internet access of my

PC which is wifi attached to a router about 3 metres away. I believe that the wifi is on about 2.4 GHz so my assumption is that the Si570 is producing a pretty big signal somewhere near 2.4 GHz. This doesn't seem a good recipe for success when looking for very weak signals at UHF and above.

Maybe it is a problem my end but I have now reverted to using the Softrock alone and have now obtained crystals which will give me 10.680 MHz without the Si570.

Comments would be welcomed.

I remember some where that case ground should be in only place and all other board grounds go to case VIA a cap - i dont think the other grounds via caps are necessary .. i imagine a loli-pop as the project and the raper is the rf sheild and where all comes in/out is a single case ground

Glad to hear that your on the right track ....

Subject: Re: [UHFSDR] 2.4 Wireless interfearence

Mike,

I found that covering the plastic case which contains the Softrock/QRP2000

with kitchen foil cured the problem. I had used a plastic case to minimise

earth loops, particularly from the antenna connection. It seems that the

best route is to use a metal case and find some method of isolating the

"earth" connection to the antenna connector.

For my purpose which is to provide a pan-adapter on the IF of my TS2000X, I

have obtained a suitable crystal for the Softrock to give me 10.680 MHz

(15kHz offset from the centre of the IF) and will use the QRP2000 for other

purposes.

I have no doubt whatsoever that the combination of Softrock/QRP2000 which I

built was creating sufficient RF to cause my wifi internet connection to be

masked. Clearly such large signals at about 2.4GHz are not conducive to weak

signal work at Microwave. It is probably my construction and not anything

inherently wrong with either the Softrock or the QRP2000 as in every other

respect they are superb kits and have provided me with a fantastic

introduction to the world of SDR.

So, a synthesizer one might consider in the future for something like
the UHFSDR is the upcoming ADF4351 from Analog Devices.
It produces 35MHz to 4.4GHz, and is the follow-on to the ADF4350,
which produces from 137.5MHz to 4.4GHz. The ADF4350 is
used in the WBX front-end board for the Ettus Research products,
which covers from 50MHz to 2.2GHz.

For a 2XLO, the ADF4351 can take it down to a conversion frequency
around 17.5MHz.

From: Rob
Topic: 16 Message: 45

Dave,

Do the harmonics result from the square wave output by si570, or are they caused by the dbm process itself? (I have assumed the si570 is square wave output as I think it is intended for use as a reference for digital phy level comms chips.)

If they are introduced by the square wave, is it possible to filter the LO signal applied to the dbm, possibly saving tx power and maybe simplifying the filtering needs...

I think the downside of this would be the need to put a wide-range frequency filter in the 'middle' of the system. Any such filter might have to go after the counter/dividers to still give them a proper edge to work with.

I guess you have considered this type of approach. What did you think about it?

Thanks
Rob

The DBM process itself produces some odd harmonics(the Balanced part reduces the even harmonics and the carrier). So do the amplifiers, although hopefully at a very low level. DBM's fed with a squarewave are actually more efficient than using a sinewave.

What this says is that RF filtering continues to be important.

If your fundamental is 700MHz, for example, then the 3rd harmonic of the
LO can still mix with 2.1GHz, and downconvert to DC, and thus
appear in the mixer output. So, input band-shaping is still
important. This is true of any broadly-tunable device, typically.
Harmonics
will generally appear on an 1/(N**2) power law, so that the 3rd
harmonic will be almost 10dB down from the fundamental, 5th harmonic will be
about 14dB down, and so on.

49. TX driver

Yahoo group: UHFSDR
Date: 2011-01-30 04:38:27 UTC
From: rainerfeldkamp
Topic: 49 Message: 49

Hi all,

After completing the UHFSDR starting with the partial kit, I am performing some measurements. Everything went fine so far, apart from the MMG3H21 driver.

The measurements confirm Step 243 of the assembly manual in that the MMG3H21 starts severely distorting below about 15 MHz. I am considering cutting the trace between C13 and C14 and replacing it by an inductor of 3.3 µH.

Has anybody a better idea to decrease the lower frequency limit of the TX driver without impairing the upper limit (ERA-5 with larger supply resistance ?).

Any hint would be highly appreciated.

Rainer:
You are correct. The impedance of L1 becomes too low at low frequency.
Either or both of the following work:
Replace L1 with a 3.3 uH
Remove C12,C13,C14.
If you plan on using the UHFSDR both at 450 MHz and 80 or 160 Meters, the inductor at L1 must still have a good RF impedance at 450 MHz(ie the self resonance frequency needs to be in the VHF range). Yaesu, in the FT8X7 designs that have a 5W amp that covers from 160M thru 450 MHz use 2 inductors in series - a 10 uH for low frequencies and something under .1 uH for VHF/UHF where the 10 uH looks like a capacitor.

That offer was from Art, KY1K. Do to a family problem, he is no longer doing the kits. Those prices did not include the Si570. Silver Fox will soon be selling a full kit. It will include a grade A Si570.

Dave:

Thank you for the excellent tip.

I ended up in simply cutting the pad for L1 adjacent C14 in two halves and bridging the gap with a 3.3µH inductor as per the assembly manual.

The driver is now linear within 1.6dB from 3.5M to at least 450M (I did not measure any higher).

Congratulations for the excellent design and thank you for your help.

Regards,

Rainer DJ6OA

Hi all,

please can you explain, what "Silver Fox" will mean?

Regards,

Dieter

The "Silver Fox" is Alan W6ARH. He will be selling a complete kit including
a grade "A" Si570, all parts, and a pcb. He is making a little money with the
kits(it is a LOT of work). He will announce availability on the UHFSDR group
and likely on the Softrock40 group.

The first 20 kits were made available on Feb 2. I don't know if he's sold
out yet (I ordered one).

64. Factor of 4 off on Si570.exe

Yahoo group: UHFSDR
Date: 2011-02-18 16:15:26 UTC
From: Jack
Topic: 64 Message: 64

Folks,

I am at checking the receiver at step 158 of the manual. I receive the 10 MHz WWV fine but with a setting on the Si700.exe of 2.5 MHz. Up until now all tests were right on; or at least I thought they were. Initially I had problems getting the Si570.exe to set the frequency (Step 72) but I thought I had the problem isolated to a bad connector at H2 and the exe program seemed to work fine. Now, after further assembly, a program setting of 10 MHz produces a 40 MHz output at TP8. I have inspected and reinspected all the soldering associated with U13 and U14 but haven't discovered a bad connection. I am starting to think that U13 may have failed. Any thought or suggestions? Thanks.

73,
Jack (W0FNQ)

Jack:
It has been a long time since I ran the program. I think it does set X4 as it was designed for the softrocks which use a /4. When you program 2.5 MHz, are you sure you are hearing WWV at 10 MHz and not 5 MHz?. You need 2X your operating frequency out of the Si570(ie 20 MHz for WWV at 10 MHz).
Sounds like things are working OK. If you use PowerSDR-IQ, it has a /2 clock selection that will program the correct frequency.

Thanks Dave -- your assessment was exactly the case. I forgot that the SIS was 2X the op freq therefore 10MHz from the chip was the 5 MHz WWV. On to the next phase of construction. All is well with the world -- spin and wobble under control. I have to wire up the interface to use PowerSDR-IQ.

67. Next issue with my build

Yahoo group: UHFSDR
Date: 2011-02-18 23:56:22 UTC
From: Jack
Topic: 67 Message: 67

Dave and other folks,

Receiver and Dummy Load tests all went well picking up lots of signals and output seems good. After soldering the T/R RF Switching section, however, I now have an issue. U7 is switching but exactly opposite of the checks in the manual, U2 checks fine. I have the AS157 chip with pins 2 and 3 of H5 connected. There is 5v on receive and 0v on xmit at this H5 jumper; but, pins 10, 12, and 5 of U6 are always 5V. I suspect this is the reason the states of pins 4 and 6 are reversed. I have checked soldering and all seems well. So I think I am left with a defective U6. Any other thoughts. Thanks.

73,
Jack (W0FNQ)

Nazim:
I just checked at the USPS site. For 3 oz to Azerbaijan, the options are:

International First Class(no tracking) $3.12
Priority Mail $13.95
Registered Service $11.50

Priority plus registered would be $25.45.
International First plus registered would be $14.62.
The nearest DHL drop off point is over 100 miles away, so I would not
consider DHL

So ... revisiting the topic of full kit ... with out the Si570.

Possibly soon?

And is there a way to get 180Deg phase from a single output that will will work with the divide by two flip/flops ? I want to add a high/low pass for the output of the Si570 to operate on the 3rd harmonic. The first thought was to use a transformer (FIN1002 maybe?)to achieve this.

Mike KC7NOA

The mixers will respond to the 3rd harmonic as is. Just put a bandpass filter on the RF input/output at 3/2 times the Si570 frequency. Response will be down just a few dB. The 10 and 15 meter softrocks used to do that. Otherwise, a center tapped transformer, with the center tap connected to 1.25 volts(center of the LVPECL range).

I was thinking of making the high/low cut at (300Mhz) the out of the Si570 to help with specturial purity (switched hi or low depending on where operation was desired) , <---- might still scrap this idea.
dont know where to get a pandpass for 1.2Ghz or even 2.4Ghz
.... 902 isnt that hard to get (already have them - centered at 915Mhz) on the output (of the combined mixers) ...

For all i know, the computer might not be able to do the image rejection at microwave operation. (heck even the traces might pose a problem at Ghz !!)

What is the highest reported freq any one has tried a UHFSDR at?

Mike:
Check at MiniCircuits Labs for bpf's. I think someone has used the UHFSDR on 1296 by using an external oscillator. The mixers are rated to 1 GHz, but will probably work at 1296 with slightly higher loss.
The image reject depends on how identical the I and Q channels are. The computer only processes audio. I made a special effort to make the line lengths as close to equal as possible in the 2 channels. I get good rejection at 450, but of course the higher the frequency, the more any small differences will show up.

Sans 570/ PCB and the mini-kit parts, the cost I am quoting is $110.38 shipped in the US. Your cost buying your own may be slightly less or more depending on shipping and parts prices.

Hi, attached is a digikey bom. Some coilcraft parts, ferrite bead, FST3257 and parts from mini-kit are missing.
You could also order a kit from The Silver Fox, because some digikey parts are not available in quantities less than 10. Silver Fox's complete key is cheaper.

david:

are those filter plots on your website calculated or measured ?

I find it hard to believe they are that good (the eternal skeptic)

It seems the unloaded Q of some of the surface mount inductors is
not that spiffy...

tell me i am wrong....ha

All,

This looks like a great project. Unfortunately, I have grown a bit long in tooth and hate4 to to be chasing 2 pieces of a 10K R, in ONLY 0805 format, while I may have a bunch in other sizes. :)

Is there a simple, cogent presentation of who is vending parts of the SDR-UHF, what is in each vendor's kit, how much they are asking, and what's left for me to source (i.e. the Si570bb)?

I like the project, not too enthused over the parts sourcing. Also, for whatever reason, Comm(ie)cast has wrecked access to Yahoo groups the past couple days. I get many 404's or just failed TCP comm links. Soooo frustrating!

Thanks for the great work done here and at other Brite-Lite sites for we hams!!. I look forward to setting up a 20m - 70cm rooftopper.

I was able to get most of the small parts from Avnet in the US. They do not have a minimum order if you set up an account and use they web site to order. They were very quick.

93. Digikey BOM

Yahoo group: UHFSDR
Date: 2011-04-28 07:54:13 UTC
From: brainerdd
Topic: 93 Message: 93

I just up loaded a spreadsheet with all needed items except for the mini-kit, the Si570, headers, and sma connectors. The headers and sma connectors are optional.
If you register at Digikey, you can upload the spreadsheet (as a xls) and order the parts without having to enter in everything. You also have the option to order more than one kit at a time.

Dave - WB6DHW

94. Kits

Yahoo group: UHFSDR
Date: 2011-04-28 08:10:06 UTC
From: brainerdd
Topic: 94 Message: 94

The Silver Fox (arhill at juno.com) has been selling complete kits including a grade A Si570 and the circuit board. I sell a mini kit that includes the 8 hardest to get items. I also sell the PCB. I just uploaded a spreadsheet with the parts needed to turn the minikit into a full kit. This does not include the Si570. They can be ordered from the Silicon Labs web page. Order the LVPECL output option. The operating frequency is 1/2 that of the Si570, so for 70 cm you need the grade A. If you don't need 70 cm, you can get by with a grade B or even a grade C.

For me .. funds are quite volatile .... usally i dont have money for radio stuff. So when i do its hard to hide from the XYL - so it gets spent fast usally.
Im sure there is plenty of interest - just no money put forth for that interest.

Its great to have a LF to near microwave tranciver for way under the cost of a TS-2000 !!!!

Kit price is a good start.

Another issue that has kept me on the sidelines here is what else is needed to build a useful transceiver. Are there add-on's such as i/o controller boards, lpf/bpf arrays, pa, etc? I am sure the existing folks know more of what it is but for the new to sdr folks like me, some better overall info that goes from buying a kit to having a useful station seems to be lacking. Maybe a story or two of what folks have built with the kit to get the juices flowing. Looking at Dave's page hard to tell what is a part of the transceiver and what is part of some other project.

Just my 2 centavos...

Im planning on getting a SDR2GO .. it will controll the Si570 and do SSB Tx/Rx (possibly AM and FM in the future)

Else a VFO from K5BCQ works ... i have one in My Atlas350XL controlling a Si570 "C" modle

....

then lets say that if you went with the controller from K5BCQ you will need a computer to demod the Rx ..... with dual line in for proper nulling of image and for Tx (i guess most programs are set to use the Rx image balance to set the Tx image balance)

just shooting from the hip ....

re-iterate ..... im really leaning twards the SDR2GO, just for stand alone operation .... but/also i already have the computer and sound card requirements ....

THEN >>>>..... still should have band filters and perhaps some kind of AMP .... (im still planning on using the guts of the Atlas 350XL for that too !!!!)

Alan,

So, what is the price, for cryin' out loud??? I'm wildly interested
at $10.00, but not at all at $1000.00. Somewhere in between, I'd
wager... :)

Thanks & 73's

Jeff, W3HVU

The only BPF I've found on wb6dhw.com is for 1.8 to 30mhz. For a device called a "UHF" SDR, I would expect it's use to be at 50, 144, 222 and/or 432 mhz!

I used ELSIE to design a 3-Pole BPF for 6m and 2m; I've only built the 2m one so far and it didn't perform well enough to use.

I found this design for a 2m BPF, but haven't had a chance to build it yet:

http://yu1lm.qrpradio.com/2m%20BP%20FILTER-YU1LM.pdf

For a 2m brick, I found this design:

http://www.aa1yn.com/dsp-10/brick/brick.html

which is similar to amps sold by Down East Microwave.

I agree, documentation on what else is needed to build a complete transceiver, block diagram, band pass filters, PA filters,
software, interconnections etc is lacking. Its certainly kept me on the sidelines too.

Mike:
After logging in, go to "MyDigikey". Under "Quote/Ordering" select "Parts List / BOM Manager <https://ordering.digikey.com/RegisteredUser/BOMWizard.aspx>". Under BOM's/Kits select "Create New BOM (Upload File) <https://ordering.digikey.com/RegisteredUser/OrderFileUpload.aspx?bom=y&ppp=25>". Then check upload type XLS and upload the spreadsheet.
I could not figure out a way to share my BOM on Digikey even though it is public.

John:
You will need some way to control the Si570 - either a parallel port or a Si570 controller board(I don't sell any, but several are available). You will also need band pass filters for receive. My BPF board works for that. You will also need low pass filters for transmit and unless you only want to run 20 mW or so, an amplifier. I have a few prototype 100W low pass filter boards and expect 100W out - 10mW in amplifier boards tomorrow.

John:
You could use a 2nd BPF board for the VHF/UHF bands(would have to design your own filter) or could omit one or more of the HF filters if you don't operate on the whole HF range.

Dave,

Thanks for the reply - some further comments...

To what effect does the higher frequency cause unanticipated side effects? I have always understood that kit building gets more difficult WRT shielding, types of coax, etc. Having a few "experienced" souls blazing the trail and documenting how they got there is missing from the community discussion, and I believe that may be causing a lack of adoption of what appears to be a dynamite design. It is one thing to say "here is what you need" and another to say "here is what he did to get it working FB".

Subject: [UHFSDR] Kits

The Silver Fox (arhill at juno.com) has been selling complete kits including a grade A Si570 and the circuit board. I sell a mini kit that includes the 8 hardest to get items. I also sell the PCB. I just uploaded a spreadsheet with the parts needed to turn the minikit into a full kit. This does not include the Si570. They can be ordered from the Silicon Labs web page. Order the LVPECL output option. The operating frequency is 1/2 that of the Si570, so for 70 cm you need the grade A. If you don't need 70 cm, you can get by with a grade B or even a grade C.

The Si570 that is in the kits is 570AAA000514DG. It is a full range chip but is not the best one available. The chip is second to the best and is spec'ed well enough to support the kit while keeping the price more reasonable. Buying the best chip adds almost $60 to the cost of the kit and considering the difference it isn't recommended.

The only difference is in the "overall stability". That is the initial frequency accuracy(which you calibrate to the exact frequency, so doesn't matter) and the temperature variation. Unless you're going between Death Valley in Summer and the Arctic in winter, I don't think you would notice the difference.

Because if you buy the WB6HDW board it is designed to be controlled via the parallel port. Is the one sold by W6ARH different?

Hi
I think you will find most USB to Parallel Ports
are only fit for Printers they do not have Bi-Directional properties

I may be wrong there maybe a suitable one out there somewhere.

Regards Peter F1VKK

I believe Peter's PA/BPF/I2C softrock kit will work also. It is overkill
but is still an option.

The ATTiny85 USB from the softrock is even easier. Tony should be able
to supply either a made up board or a programmed ATTiny85 and the rest
of the circuitry would be very easy to put together.

Having a problem with the HSUSB
Installed the software pluged it in.
Windows cant load a driver????????????
(win 7 x 64)

Are there any notes on what i have to do to set this up ready for the
UHF SDR

thanks Colin

There on notes on the PowerSDR-IQ webpage on setting up the HSUSB board for the UHFSDR and PowerSDR-IQ . It could be a win 7 X64bit problem. They require signed drivers. I have not tried it on win7 X64(I do have win7 X64 on my laptop and win7 X32 on a desktop). I would expect that Cypress would have a Win7 X64 driver for the CY7C68013A(they sell them by the millions). Perhaps someone else has been successful. I will check later to see if I uploaded the PowerSDR-IQ instructions. If not, I will do so.

The PowerSDR-IQ setup for the HSUSB is at
<http://code.google.com/p/powersdr-iq/downloads/list>
I use PowerSDR-IQ v1.12.20. I have not tried it with the HSUSB board since
all my computers have a parallel port. I also have not tried it on Win7 yet.

Topic: 119 Message: 130

Dave, just to get this clearly in to my head, you are NOT saying that it can't be controlled by the parallel port? I ask because in your UHFSDR Assembly manual, page 10, it states that it can:

PowerSDR-IQ includes provisions for controlling the Si570 and the T/R line of the UHFSDR. The parallel port connections are different than other PowewrSDR versions.

UHFSDR db25(Parallel Port)

H1-1 connect to 5V TP next to H1
H1-2 19 Ground
H1-3 1 I2C SDA for Si570
H1-4 16 I2C SCL for Si570
H2-3 25 Ground
P2-1 8 /Rx Tx

IIRC the hsusb requires the output lines to be loaded in order to enumerate. I wasted much time with this but what's new. Sometimes I could get it to reset my loading the pins with my fingers.

Search or ask the "Silver Fox"... I think the full kit is 202$ USD for domestic still.

From: dave
Topic: 119 Message: 134

Yes, the parallel port control works. That is what I use. This USB to parallel port discussion is only for those that don't have a parallel port.

135. Full Kits

Yahoo group: UHFSDR
Date: 2011-05-02 21:03:37 UTC
From: The Silver Fox
Topic: 135 Message: 135

I am currently out of stock on the full kits. My Xyl is not happy with me spending so much time with the kits so she will not let me front the money for future orders. That's the bad news. The not so bad is that if I can get ten orders prepaid, I think I can move forward on the orders for more. The caveat beyond paying up front is that the lead time on Si570's is indeterminate but the last time it took six weeks. Please let me know if you can tolerate these conditions and I will post the status as it proceeds. There is no need to pay until I get ten committed buyers.

Cant find any notes on the HSUSB
I have the WB6DHW HSUSB -R1
Do any of the headers need jumpers?
Still cant get windows to load the driver even tried Xp sp3

Need some Doc's of PDF for the board
No help from the WD6DHW site
Do we need firmware

MoDMJ
Sorry I took so long. I hold a build session for our club on Tuesday afternoons(they are building HF transceivers!).
There is a jumper at H1 to select the power source for the chip. Shorting pins 1 and 2 will select USB bus power. Shorting pins 2 and 3 selects external 5V (from J2).
The CY7C68013A uses RAM for its program, so it is loaded each time. The .ini must point to the file that must be loaded. Also, the first time the board is powered up, the EEPRIOM is blank and the chip will enumerate at a blank Cypress chip. The EEPROM will then get programmed with a different set of Vender ID and Product ID, requiring a driver matching the new Vender ID and Product ID on the next power up.

Ok getting somewhere now.
Cypress have no signed drives for windows 7
(Got around that its a pain have to boot using F8 unsigned driver opt each time I want it to work).

With the eeprom soldered in cant find the device.

With it out and a cyusb.ini file (from your site).
Cysuite 3_4_5 B192 finds the device with this string.
%VID_04B4&PID_8613.DeviceDesc%=CyUsb, USB\VID_04B4&PID_8613
this gets to the cypress chip ok
(cant see what file the ini is pointing to to load?)

so which file do i send into ram?
and which file do i send into the eeprom?
then maybe it will control the SI570 in UHFSDR

Colin:
There is a driver on the PowerSDR-IQ download page for the HSUSB and a hookup diagram. I have not tried it myself, but have heard of others using it.
<http://code.google.com/p/powersdr-iq/downloads/list>

Good Morning,

Please count me as a commitment to buy one of your kits. Please let me know when to send the payment. I assume you accept PayPal but if not what form would you like?

Reach me at my email address ted@...

Thanks and 73,
Ted

From: Colin
Topic: 136 Message: 151

gettin there...
downloaded the driver on the PowerSDR-IQ download page for the HSUSB.

(The hsusb.inf was set up for xp new Hsusb.inf txt below open up HSUSB.inf in notepad copy txt below and paste into inf and save)

So heres the work around for win 7 x64
1)Not not insatll Cysuiteusb into program files...
put it into root drive

2) Copy the HSUSB.inf and CuUSB.spt into the D:\cypress****\Driver\bin\wlh\x64

3) reboot pc..... as whe BIOS screen pops up keep pressing F8
need to boot pc with unsigned driver option

4) install driver ..use have disk mode and point to HSUSB.inf

5) Start Cypress USB Control Center.
if all wis working well the HSUSB should work

(HSUSB.inf win 7 x64)

```
; Installation INF for the HSUSB Driver for Windows 7 x64

152. RE: [UHFSDR] Si570 startup

Yahoo group: UHFSDR
Date: 2011-05-07 14:02:03 UTC
From: MIKE DURKIN
Topic: 135 Message: 152

Ok ... Just looked up the start up freq of the Si570 that i had acquired a month ago .... Now i can set it into the UHFSDR that arrived Thursday and see if it works ok ..... then i can sell the one that came with the full kit.

Dave,

I am under the impression that it would not take much to modify the PCB to be USB interfaced vice parallel port. Is this a possibility in the future?

It would require an additional chip. I am looking at changes to simplify the design as well as include USB for a future build.

155. Vcc for U6

Yahoo group: UHFSDR
Date: 2011-05-13 21:16:43 UTC
From: seth_otherpower
Topic: 155 Message: 155

How does Vcc get to U6? I was following the assembly manual .. and after installing the voltage regulators :

Voltage Regulators:
1. Install U1 (7805)
2. Install U12 (LP2992AIM5-3.3)
3. Install C1,C2,C40,C42 (10uF)
4. Install C41 (.01uF)
5. Install R1 (12ohm;2W)
6. Install FB1
7. Apply 7 to 15V to P1-1, Ground to P1-2.
8. Verify the voltage at P1-1 is also at the following locations:
U1-3 (7805) ☐ Note voltage will be less due to R1. Voltage must be > 7.0V
U11-1
U10-8
Q5 emitter pad
9. Verify 4.75 to 5.25VDC at the following locations:
U1-1(square pin ☐ 5V output of 7805)
U12-1
U12-3
U17-8
U18-8
U8-16
U9-8
U6-14 nothin at this point
U6-10 nill
U6-12
U6-5

U6 VCC comes from FB1. The other side of FB1 connects to the 5V output of U1(7805).

When soldered, the square pad doesn't look square again. Checking continuity between the pins and ground is the best test, ground which is pin 2 is nearest to the edge of the board. The same applies to other connectors once you know which is ground pin you can determine which is pin 1 in most cases.
73 ... Sid.

Topic: 159 Message: 163

It often is, but the main point is that if you can establish which pin
is ground whilst checking against the schematic you'll know how the
connector is laid out.
Some minutes ago I needed to check a header on a Mobo v4.3.4 which has 2
pins, the schematic says pin 2 is ground. I checked both for continuity
to ground, so I established which is pin 1 and which is pin 2.
I've done such checks for larger connectors. If you know where pins
connect to, say on a connector with multiple grounds, you can meter
between the signal pins and their destinations on the schematic to be
sure where a pin is routed.
73 ... Sid.

Mike:
Depends on your Si570. You can find out with the part number at
<https://www.silabs.com/products/clocksoscillators/Pages/LookupPartNumber.aspx?cm_sp=%3CWebParts%3E-_-%3CBuyXOsVCXOs%3E-_-%3CLookUpCrystal%3E>
All of the Si570's supplied by any of the kit suppliers have included chips
with a high OE. The chip has an internal pull-up, so you can leave the H2
jumper off unless you need to control that line.

166. Oscillation at U10 Pin1 and Pin7

Yahoo group: UHFSDR
Date: 2011-05-17 13:26:05 UTC
From: dl5cn
Topic: 166 Message: 166

Hallo,
when I started to test the PCB I found an oscillation at the
audio amps, U10 Pin 1 and Pin 7.
The DC-Levels are as decribed in Dave's manual.
The frequency was around 600 KHz, nearly 3V peak to peak.
There was nothing visible at Q1 and Q2.
When disconnecting the line-in cable, oscillation disappeared.
First, I added two capacities 33p, one parallel to R21, the other
parallel to R22. No further oscillation.
So, it seems, the Opamps are oscillating with a given load.
Probabaly resistors R68 and R69 have to be increased instead.
Did anybody watch similar things .

Are you supplying a voltage to H1-1 equal to your driving logic voltage(3.3V or 5V)and a ground to H1-2?

H1-1is tied to TP1 - 5V - Vdd2 has 3.3v ....
GND1 is grounded and shows .1ohm to mounting rings. H1-3 & H1-4 have 3.22V on them. (TP1 & TP2 showing 3.3v)

When either H1-3 or H1-4 Is grounded nothing happens with TP1 & TP2 ..

Im following along with steps 30 through 43 in the Assembly manual.

More checking .. A Ok from the Si570 .... Dc is 1.17V and since i only have a single trace scope - both TP8 and TP9 show .4V P-P .... Looking ok.

So i checked /Q and Q (pins 6 & 7) both IC's show /Q at 4.1VDC and Q at 3.1VDC .... ideas on what to check ?

Vcc for U18 & U17 are good 4.98VDC ....

Seth:
I have a high res picture of the UHFSDR-r1 (the only changes for the r1a are in the lower right hand part) at
<http://wb6dhw.com/UHF-SDR/production/UHFSDR-r1_HiRES.JPG>
Check that you have continuity between the following:
U17-1 to U18-6
U17-2 to U18-7
U18-1 to U17-7
U18-2 to U17-6

Also check the ground connection and the VCC.

Many SMT chips have a bevel in the end of the chip corresponding to pin 1, not a dimple or dot. Did you check the manufacturer's data sheet to see what they use?

When in doubt, I usually start checking the power and ground traces to see if they meet where I think they should. If there is more than one ground connection, so much the better.

Good luck!

From: The Silver Fox
Topic: 182 Message: 182

The mobo kits are still available and I have no plans to stop producing them as long as orders persist. There are more than 200 boards out there and improvements would still be of benefit.

The UHFSDR full kits are in a lull and currently only two kits remain. Once I can order si570's I will make them available again. The demand for them has not kept the cash flow rolling enough to sustain constant supply. I have parts for the full UHFSDR kits without the si570 for anyone who is interested.

The big pin is #2. Alignment is going away from the edge of the board ... pin #1 denoted by silk screen dot next to H5. Pin #2 is next to the 4 of the silkscreen of U4.

Hope this helps someone.

I might be interested in a full kit without the si570 depending on the price. If it saves you a lot of time, and me some money, I don't need the capacitors and resistors either. Can I assume the PCB is included?

The mobo kits are still available and I have no plans to stop producing them as long as orders persist. There are more than 200 boards out there and improvements would still be of benefit.

The UHFSDR full kits are in a lull and currently only two kits remain. Once I can order si570's I will make them available again. The demand for them has not kept the cash flow rolling enough to sustain constant supply. I have parts for the full UHFSDR kits without the si570 for anyone who is interested.

Depends on the software. If no offset, you tune to 10 MHz X 2. If using PowerSDR-IQ, which defaults to a 9 KHz offset, you would tune to 9.991 X 2 = 19.982. If you bought the kit, that is the default freq. of the Si570. With a default freq of 19.982 asnd ZPowerSDR-IQ you should be able to receive WWVat 10 MHz(assuming you have propagation to either Boulder, Colorado or to Hawaii for WWVH).

Topic: 182 Message: 202

Hi Alan,

I was very keen on the UHFSDR kit and asked you to put me on the list. Later on I realised that I would need other sub-systems to make it work, such as bandpass transmit filters. This has put me off buying because I don't know what else I might need.

Would you be able to put together a list of what I would need to get a fully working tx and rx system ?

If you can do this, please assume I have nothing other than a few bench power supplies, a couple of sub-1MHz sig gens, an oscillope and a few PCs. I have parallel ports available and I guess I should leave control via usb for another day. I can run linux, windows or solaris.

I think I need a physical means of programming the si570, some tx/rx band pass filters and software such as powersdr, to decode/encode I&Q channels. I don't know what hardware is available, or its costs, to fill these needs and I don't know what additional software I need for programming the si570.

I had mis-understood the UHFSDR as a complete system but would still be interested if I can understand the whole system needed (and its costs).

I hope you can help with this.

Thanks
Rob

PS Apologies if this has already been answered, I did search this and softrock40 groups.

Rob:
For a complete transceiver that meets FCC requirements, you will need a set of receive BPFs, a set of transmit LPFs, and a RF power amplifier(assuming you want to use more than 50mW). For Software, PowerSDR-IQ can be set up for the UHFSDR. Since you have a parallel port available, that is the easiest way to control the Si570. PowerSDR-IQ can do that.
My BPF board will work for a set of 1.5 to 30 MHz BPF receive filters. For VHF/UHF, you would need to use another BPF board with VHF/UHF filters or design your own. The UHFSDR works without receive filters, but will be subject to the 3X, 5X, etc responses that all DBM mixers have.
I have a 100W low pass filter board that I designed for our club transceiver project that is controlled via the I2C bus. This would require an addition to the software for full control. It could also be wired for manual control.

If anyone has designed and built VHF/UHF filters for this board, I would appreciated it if you would share the design. I've got a couple of projects that are in need of a good filter. I used Elsie to design some bandpass filters, but haven't gotten one to work right.

I found this filter design, but have not constructed on myself (yet):
http://yu1lm.qrpradio.com/2m%20BP%20FILTER-YU1LM.pdf

This is what I plan to use for an amplifier:
http://www.aa1yn.com/dsp-10/brick/brick.html

it uses the same amplifier part as found in Down East Microwave products.

Thanks Alan,
I just found some on EBay and have ordered a set of 5 AS169's for $10.49
free shipment from USA.
I'm about to solder in a .1 between U4 pin 3 and Ant_Sw as a temporary
workaround for RX. I I decide to go on to TX I can even use a small
sealed metal cased +5V relay as I have some in a parts cabinet in the loft.

206. which si570?

Yahoo group: UHFSDR
Date: 2011-06-16 03:35:43 UTC
From: Edward
Topic: 206 Message: 206

All,

Hello, I am new to the group and trying to make an SDR for my microwave IF. I ordered a board and a "mini-kit".

Is there a good source (to buy) for an Si570 appropriate for a 144mHz transverter interface? (such as KM5H)

Also, when one speaks of an A/B/C part, are they talking about the frequency range or the interface type?

It may also be useful if this would receive on 432 mHz so it could be used as an IF for a 24gig transverter...

tnx,
Ed wa3drc

Yahoo group: UHFSDR
Date: 2011-06-16 03:37:17 UTC
From: brainerdd
Topic: 170 Message: 207

If you are going to use the UHFSDR as a fixed freq. IF for a UHF or higher station, order an Si570 with startup freq twice that of the IF. ie for a 144 MHz IF, order with startup frequency of 288 MHz. If you don't need to vary from that frequency, you won't need to control the Si570. If fact, you could use a Si550 or a Si595 fixed freq chip(Silicon offers free samples of these!). Order the LVPECL option. CMOS will NOT work because the UHFSDR needs both the Q and Qnot outputs to generate the I and Q.

Dave,

I do need to tune the IF from 144.000 to 144.300 to find both contacts and beacons. I now understand I should find a Si570AX(A/B)... part to work at 144/432 mHz.

Is there a ham source for this, or should I try direct from silicon labs?

tnx,
Ed

Ed:

A,B, or C refer to the speed. For 432 you will need the A(most expensive) grade. You can order from the Silabs website at <https://www.silabs.com/products/clocksoscillators/Pages/XOVCXOUtility.aspx?cm_sp=%3CWebParts%3E-_-%3CBuyXOsVCXOs%3E-_-%3CBuildCrystal%3E>
It will end up saying "back orered" because they have to program the startup freq. in the factory. Takes 2 to 4 weeks to receive.

Mats,

If it helps... I just ordered all the remainder of the parts (aside from the PC board, mini-kit, and Si570) yesterday from Digikey. The Digikey order was for ~$32.00 USD.

BTW, I used the spreadsheet on the UHFSDR web site to upload to Digikey. My order shipped 35 minutes later.

Subject: [UHFSDR] Re: Silver Fox de sm0rjv

Mats,

If it helps... I just ordered all the remainder of the parts (aside from the PC board, mini-kit, and Si570) yesterday from Digikey. The Digikey order was for ~$32.00 USD.

BTW, I used the spreadsheet on the UHFSDR web site to upload to Digikey. My order shipped 35 minutes later.

Mats,

We will probably be bringing these up at the same time. Good Luck!

Hi Alan,
I wonder if you have any spare components for the UHFSDR available.
Everything was going fine with the build, then after a power down and
power on again I hit problems with I2C which I traced to the
LP2995AIM5-3.3.
Input voltage +4.99V, output +2.2V.
I lifted pin 5 and wired in my trusty standby LM317T +3.3V regulator
that I knocked up some time ago when one was DOA on a SR63ng.
That (+3.29V output) confirms the LP2995 is faulty.
U13 (ADUM1250) was also faulty before U12 died but I have spares on
hand, so that is fixed.
If you also have CDSU101A's spare also, contact me direct, I'd like to
grab one or 2 - AVNET are asking a king's ransom for shipment.
73 ... Sid.

Sid,

I will check the inventory and get back to you. Thanks to the continued interest in the Mobokits, I am getting close to being able to do another run of TEN full kits. I will notify the group when I have an expected availability date.

217. UHFSDR Performance

Yahoo group: UHFSDR
Date: 2011-07-11 04:58:39 UTC
From: nwplouff
Topic: 217 Message: 217

After reading all messages in this Yahoo group and skimming UHFSDR-related messages in the SoftRock40 group, still looking... Has anyone measured the RX or TX performance of UHFSDR on any band?

In the Softrock group, there is a thread <http://groups.yahoo.com/group/softrock40/message/49153> from October 2010. One writer says UHFSDR's performance is comparable to his commercial HF and VHF rigs. There's also a YouTube video <http://www.youtube.com/watch?v=0VymGjoI9IE> that shows a bare UHFSDR board operating quite nicely on what appears to be 40 meters.

Are there any numbers available, though, or comparisons to other rigs?

Wes AC8JF

218. Re: [UHFSDR] UHFSDR Performance

Yahoo group: UHFSDR
Date: 2011-07-11 13:37:19 UTC
From: Sid Boyce
Topic: 217 Message: 218

The first comparison I made was with the IC-7200 and the SR v6.3, it compared favourably listening to stations. However, I have not made any measurements.
My first UHFSDR still needs a bit of troubleshooting as I have an image problem, L channel is dead. When it was working I was quite pleased with the performance. I did have a spate of si570A's failing, the first after about a month followed by 2 others that were DOA and I think removing parts while troubleshooting the si570A problem accounted for the present problem but that'll easily be fixed.

Last night whilst building the second UHFSDR I did some RX tests on 20m and 40m, so far so good. Next moving on to building the TX and RX amps in the next few minutes.
I have a 5W PA ready when TX is ready to be tested.

The main attraction of the UHFSDR is the wide coverage it offers in a small package.
Currently I'm using it with the SDR-Widget.

Others have moved further on, like NO5K on the AQRP group who has used it on 2m as a standalone rig controlled by the SDR2GO and with good results.
Larry (W9AMR) has also done some work getting the UHFSDR + SDR-Widget + Mobo v4.3.4 going, so it's also very flexible.

I must like it very much as I bought a second kit.
73 ... Sid.

Alan,

For those of us in the middle of traumatic change of QTH and career,
is there a full kit available (all but the box...) with a price? I
believe I have seen partials, but never a complete UHFSDR listing.

Thanks & 72's,

Jeff,

I am about to order more components to fill ten more orders and in the past there has unfortunately been a several week lead for these important parts. I am willing to take up to ten orders but it is not necessary if you are willing to take your chances with the availability. Frankly, I have been surprised that with the number of participants of this list, that there hasn't been more demand. Then again, there is no web advertisement for these kits.

YES. I DO MAKE THE KITS AVAILABLE SO KEEP WATCHING THIS GROUP'S MAIL.

Hi Alan,

Thanks for the prompt reply. What I was looking for was a price for all the parts and PC boards. I know that sometimes we have to wait weeks for parts; that's ok with me. But I need to know how many Yankee Dollars I am looking at. This move is costing me hobby $$, so I must be a bit prudent. And that sux!! LOL

I could easily do that if there was a less expensive and reliable means of payment. Paypal and other overhead are responsible for the apparent inflation. Over time some pieces go up in price but then again, some go down.

The main driver is the cost of the Si570. If the customer base wanted the best, the cost would increase by more than $50. While there was a comment about getting the partial kit and ordering $35 worth of parts to finish I am very doubtful since my calculation is it is over $100.

Thanks for the suggestion. I am happy to take suggestions and criticisms to help the group.

Alan:
The $35 is the cost if you use my DigiKey BOM. But, that does NOT include the Si570 and that is in addition to the partial kit, which is $40 for US, and the PCB, which is $10. That brings the total to $85 without the Si570. The 1.4 GHz Si570's, last time I checked(several months age), ranged from $60+ to $100+ from Silicon Labs. Alan adds some to the price because it is a LOT of work to put the complete out and he has a lot tied up in parts inventory. There is also the cost of the shipping materials(bags for parts, envelopes, etc). That also does not include an enclosure.

228. Re(UHFSDR) Prices Build

Yahoo group: UHFSDR
Date: 2011-07-13 19:19:23 UTC
From: Alvey Street
Topic: 228 Message: 228

The prices seem OK to me Dave. I must put together the partial kit that
I bought,
now that Farnell have supplied the rest. While I am doing this build, I
will time
everything and try to arrive at a realistic cost for building the kit.
There may be
some interest out there from people that would like a built and tested PCB.
Anybody interested in principle?
Regards Vin

I'll do another price run when I order the si570's. I think people forget that you have to include shipping and taxes when they apply to the acquisition of inventory. I spend a lot of time re-packaging and identifying the components. I am not experiencing much in the way of profit. At the moment, it all goes back into inventory resupply.

Alan:
The $35 is the cost if you use my DigiKey BOM. But, that does NOT include the Si570 and that is in addition to the partial kit, which is $40 for US, and the PCB, which is $10. That brings the total to $85 without the Si570. The 1.4 GHz Si570's, last time I checked(several months age), ranged from $60+ to $100+ from Silicon Labs. Alan adds some to the price because it is a LOT of work to put the complete out and he has a lot tied up in parts inventory. There is also the cost of the shipping materials(bags for parts, envelopes, etc). That also does not include an enclosure.

On 7/13/2011 9:26 AM, The Silver Fox wrote:

I could easily do that if there was a less expensive and reliable means of payment. Paypal and other overhead are responsible for the apparent inflation. Over time some pieces go up in price but then again, some go down.

The main driver is the cost of the Si570. If the customer base wanted the best, the cost would increase by more than $50. While there was a comment about getting the partial kit and ordering $35 worth of parts to finish I am very doubtful since my calculation is it is over $100.

Thanks for the suggestion. I am happy to take suggestions and criticisms to help the group.

Definitely true. Multiple sources mean multiple shipping charges. The less kits, the less people to spread out the cost of the shipping. Also, some items may not be available in single quantities. The prices I mentioned did not include the shipping(except for the mini kit and the PCB). Unless you have supplied a kit, you don't realize the time and effort involved.

From: The Silver Fox
Topic: 135 Message: 231

I am currently engaged in a dialog with the Si570 provider and their web based price is currently indicating $119.09 for the previously available one for $57.13. I'll let everyone know what the outcome is. If the price holds high, there may be a delay before I can reconcile the price increase and justify covering the cost of inventory.

238. Full Kit Status

Yahoo group: UHFSDR
Date: 2011-07-18 21:36:50 UTC
From: The Silver Fox
Topic: 238 Message: 238

I am close to being able to offer more full kits. The good news is that if I can manage the discount price for quantity of the Si570's I will be able to lower the price to $190 US and $196 DX. The bad news is that I cannot afford the up front cost of the Si570's. What I have in mind is offering three or four folks out there another $20 discount to pre-order. The only downside is that these pre-payers will have to wait the lead time for the devices which is four to six weeks but they will know that they are supporting the group and getting a discounted kit.

Alan,

So what I think you are saying is with a prepayment of $170, I can get a kit in several weeks. Do I send a payment to you via Paypal?

Best regards,

Tony

Yes. That is true. To make folks feel better, I will not spend the money until I am able to purchase the si570s and I will refund it if something prevents me from pursuing the purchase. Paypal money to alan.r.hill@... and remember to include your shipping address.

Alan,

So what I think you are saying is with a prepayment of $170, I can get a kit in several weeks. Do I send a payment to you via Paypal?

Best regards,

Tony

On Mon, Jul 18, 2011 at 5:36 PM, The Silver Fox <alan.r.hill@...> wrote:

I am close to being able to offer more full kits. The good news is that if I can manage the discount price for quantity of the Si570's I will be able to lower the price to $190 US and $196 DX. The bad news is that I cannot afford the up front cost of the Si570's. What I have in mind is offering three or four folks out there another $20 discount to pre-order. The only downside is that these pre-payers will have to wait the lead time for the devices which is four to six weeks but they will know that they are supporting the group and getting a discounted kit.

From: dave
Topic: 241 Message: 241

I just took a look at the Si514. It is specified from 100 KHz to 250 MHz.
It is a slightly different pinout from the Si570. It is in a six pin package(no small end pins). Pins 1 and 2 are the I2C inputs. The other pins are the same as the Si570. For operation from 50 KHz to 125 MHz, it should be possible to use the Si514 with minor changes to connect the I2C pins. A different mixer would possibly have to be used as the ADE-2ASK is only specified down to 1 MHz. Mini-Circuits does have others in the same package.
The price of a Si570 for .1 to 250 MHz is $12.95 from SiLabs. The one downside is the phase noise is higher at 1 pS vs .3 pS for the Si570.

Mike:
I just compared the Si514 and the Si570 datasheets. There is a 13 dB difference in phase noise. That would of course affect weak signal reception. But, at low frequency, I think the ambient noise is dominant, so you wouldn't see the difference(I haven't actually listened below the broadcast band). You could always put a mixer and oscillator ahead of the UHFSDR for low freq. operation. The 1 MHz on the ADE-2ASK is the LOW end.
I have just been looking at the next UHFSDR and possible options and ways to reduce the cost.

I have been having circular discussions with Silabs for purchase of the Si570. The last batch they sent me cost roughly $58 per chip. They are now indicating $98 a chip. If I buy 25 they will lower the cost to $75. This is not their best chip which is even more expensive. I don't see how their prices are justified if there is a comparable chip for cheap.

*Maybe time for a re-design?

The ADF4350/ADF4351 are nice chips, and (ADF4350) are available from
Digi-key right now for $22.50 apiece. Once the ADF4351
is in production, it'll produce outputs from 35MHz to 4.4GHz, which
for a 2XLO design like the UHFSDR, gives you 17.5MHz to 2.2GHz
coverage, depending on how wide-band your mixer is. The ADF4350
(pin-compatible older cousin of the ADF4351) covers 137.5MHz to
4.4GHz.

I have been looking at a redesign. I just took a quick look at the ADF4350 datasheet. You need to add an external reference oscillator. You also need to have external loop components to form the PLL. Also, at VHF, the phase noise does not look to be very low. That's a initial quick look at the data sheet. The other Silicon Labs "any frequency" devices - the Si514 and the Si598 are lower spec than the Si570. The Si514 has 3 grades with a max freq. of 250 MHz and 13 dB more phase noise than the Si570. But, it is specified to go down to 100 KHz. The Si598 has a max frequency of 525 MHz and phase noise just slightly higher. If 70 cm is not needed, the 525 MHz Si598 is available for $16.98. You could possibly add another mixer with a circuit similar to the VHF Softrocks(except using DBM's) and extend the frequency. The operating frequency would then be 1.5 times the Si598 frequency.

A 20ppm TCXO for a reference is pretty cheap ($4.00), and the external
loop components are quite modest. I've used a product
based on this synthesizer for SDR, and it seems to be just fine for
my applications, and what others are using it for, even at VHF.

Actually, ADI claims -155dBc/Hz phase noise at 137.5MHz output at 1MHz
offset, which probably means that the "close in" phase noise
is no worse than -85dBc/Hz or so. Which isn't "stunning" but it's
perfectly workable even for narrowband stuff.

I just got an email from Chris Waldrup. He has assembled some of my boards in the past for people and is now again available to assemble boards. His work is very professional(he was a professional board tech). For those that have asked for assembled boards, contact Chris Waldrup at
<kd4pbj@...>

We can arrange to have the board and parts sent to him and he can send the assembled board to you. That saves one shipment charge.

I am now offering prototype boards(I have 12 left) of my 100W Low Pass Filter Board. The board is 3.0" by 7.2" and will hold seven 5 pole low pass filters. Extra holes and pads are provided to use paralled capacitances at each position. The filters can be either Elliptic or standard low pass. Relays are used to switch the filters into or out of the circuit. Control can be either manual or via I2C. I also plan in the near future to offer a complete kit for approx $70 containing all parts except connectors and case. The toroids are T50-2, T50-6, and T50-10. All filter caps are 500V silver micas.
Wolfgang Kinkeldei has built a manually controlled board and has provided a set of tested filter designs. My schematic does not show the 30M filter and the 20M is a copy of the FT-857 design rather than Wolfgangs to provide for a 160 meter filter. The schematic, a scanned image of the board, and a BOM are available at

251. Individual Digi-Key order

Yahoo group: UHFSDR
Date: 2011-07-24 22:15:15 UTC
From: nwplouff
Topic: 251 Message: 251

Back on July 13, Dave WB6DHW said that ordering parts from Digi-Key cost $35 per UHFSDR board. That is, for the parts not included in the mini-kit. I just ordered from his BOM at a cost of $53 plus tax and shipping. Some of this is the price break for buying the entire BOM in quantity vs. just enough for one board. I'd say at least $10 of the difference is because most of the surface mount resistors and capacitors have a minimum order quantity of 10, though needing only one or two on the board.

I did not buy the SMA connectors. I still need to buy the ferrite bead and the FST3257 multiplexer IC from Mouser. The last two items add less than a dollar to the cost.

This suggests to me that a club or group buy is better for keeping parts costs down and avoiding leftovers.

I'm not complaining. I'd do it this way again. Just wanted to throw a reality check out to the group, though.

Also -- from Dave's BOM I had to make the following changes:

1000 pf cap - Panasonic part is obsolete, substituted DK 490-1622-1-ND

DK part no. for 0.1 uf is 399-1168-1-ND

DK part no. for 560 nh inductor is 553-1047-1-ND

130 ohm resistor - substituted DK RMCF0805FT130RCT-ND

DK part no. for CDSU101A diode is 641-1002-1-ND

Correct part no. for stereo jack is CP1-3525N-ND -- that's a "one" not an "eye."

From: priddix
Topic: 254 Message: 254

The packet was marked HMC544 and the instructions say jumper H5-1 to H5-2, but I got no connection through the pins specified and it looked like U2 was faulty.

With AS157's and AS169's on hand I changed both to AS157's and jumpered H5-2 to H5-3, same problem - no RX signals.
As a SWAG I decided to jumper H5-1 and H5-2 and bingo, I'm receiving off-air signals. Pity I didn't try that before replacing U2 and U7.

On my first UHFSDR from Art going back quite a while, they are AS157's and H5-2 to H5-3 has the jumper.

It's as though the part has undergone a change in recent batches.
Has anyone else encountered this?

Is there a measurement for the mounting holes - centre to centre ? for the SDR2GO and UHFSDR ?

Did you order fro the BOM that is on my webpage or from the public BOM on Digikey (BOM # 31700)? I just created an order from the DigiKey BOM and all parts were available. The total came to 31.13. Should be 44 different part numbers. Looks like I need to check the BOM on my site and update it. I changed some of the parts for the DigiKey public BOM to get away from the min 10 orders as much as possible. Note also that the public BOM at Digikey does not include parts that are in the minikit.

There's a public BOM at Digi-Key? I did not know that. I ordered from the BOM in the files section of this Yahoo group. Ah, well, live and learn...

As mentioned, still had to order two items from Mouser.

By the way, in no way was my posting intended to disparage Alan, the Silver Fox. I think he's doing a great service to UHFSDR builders. After wading through the details of making a Digi-Key order, I'd say he's not charging nearly enough for his time.

Hi there
Just wondering how to access that public bom on digikey.
Thanks

I am not sure. It is BOM # 31700 and is under Bluebird Originals.
Otherwise, you can upload the spreadsheet available on my for_sale page.

Hi Alan, Dave,

Is there an estimated date of delivery for the complete kits?
Are you moving into a 'group-buy' direction or are you willing to have stock of the kits for future purchases?

262. USB2SDR & UHFSDR

Yahoo group: UHFSDR
Date: 2011-08-03 07:17:43 UTC
From: sv1eia
Topic: 262 Message: 262

Hi Dave,

I guess you remember that I was one of the guys that rushed in when you first announced the UHFSDR a few years back to get a kit from Art those days.

One of the very first kits given, yet left in the drawer for so long.
That was until recently when I started to offer the USB2SDR, then I received quite a few messages from USB2SDR users that they have the UHFSDR and want to know how to make the connections for it.

So my interest has been renewed on this and got involved actively in the integration.

So far it seems that USB2SDR and UHFSDR is a very well cooperating couple with control connections of I2C and Tx/GPIO being straighforward.
The other thing that remained to do was the PowerSDR-IQ modifications for it, so I did that too in the latest 1.19.3.20 (USB2SDR) version and got divider by two and a working extended bands setup 2m/4m/1.25m/70cm.

So now, I'm a happy user having USB2SDR and UHFSDR operating Rx and Tx from 1.7MHz to 470MHz and it is FUN INDEED !!

I do feel sorry that I did not have it built when I first received the kit some years back but at least now its really nice to have it working here and I do like it very much. :-)

One of the users, Serge RV3APM got me involved again in this so I have to thank him, I was a bit reluctant at first since my hands are full nowadays with the USB2SDR but it was certainly worth it
-> http://www.lampradio.net/USB2SDR.html

Dave, I think there is something that will bring UHFSDR to another level.
That something is the addition of a UHFSDR BPF for its receiver.
If you design a BPF with enough banks in octaves to cover the whole extended range and do that with I2C control, then UHFSDR will make a invaluable addition to any shack.
There are not many general coverage, up to UHF, transceivers (SDR capable) and I know that we are very near in having this right NOW !

So I'm just adding my bit here for any future directions that you have in mind.

73,
Christos SV1EIA

Christos:
I have a BPF design for our club project that covers160 meters through 70 cm(except 220 MHz and 70 MHz(not a USA band)). Right now it is part of a larger board with some other functions. But, I do plan on putting the PBF's on a separate board. They are I2C controlled using a PCF8574A and CBT3251's. But, I think I should think about allowing for more than 8 filters.
I also have a 100Wlow pass filter board(see my under development page) that has filters for 160M thru 6 meters-seven filters), also controlled by a PCF8574. Both boards allow board level selection of I2C addresses with jumpers. I also have prototype 100W amplifier boards(a pair of RD100 transistors plus a driver and pre-driver) that I hope will work with the UHFSDR as well. It has forward and reflected power and temperature measurement capability. I have not yet assembled a board.
In addition, I plan on designing a control board, likely with a PIC with lots of memory, USB, I2C. Probably a 40 or 44 pin device. Will control an LCD display and read a rotary encoder plus pushbuttons.

Yes, thats more like it.
IMHO this is the component thats needed now.
The addition of 4m and 1.25m whould be good though.
I also think that more than 8 banks are needed.

Do you have any plan of when you can move on with it and have something out?

Dave,
Your original BPF board seemed to work out quite expensive, especially the SMT inductors. Is there a different approach to the new one and will it still be 7 pole?

Christos:
I don't have a time frame yet for the BPF's. One thing you could do is use 2 of my BPF boards. The decoder used does have an enable/disable pin. But it is no I2C controlled(3 binary data lines and the enable).

Sid:
Will have to decide on how many poles. The filters for the club project are 5 pole. I could easily use T25 toroids. In fact the current BPF board can be built with T25 toroids, although the number of turns for each has not been worked out. I do plan on something with better Q than the smt inductors. That causes a 4 to 6 dB loss in the filters.

Subject: Re: [UHFSDR] USB2SDR & UHFSDR

Dave,
Your original BPF board seemed to work out quite expensive, especially the SMT inductors. Is there a different approach to the new one and will it still be 7 pole?
73 ... Sid.

Hi Dave,

I guess you remember that I was one of the guys that rushed in when you first announced the UHFSDR a few years back to get a kit from Art those days.

One of the very first kits given, yet left in the drawer for so long.
That was until recently when I started to offer the USB2SDR, then I received quite a few messages from USB2SDR users that they have the UHFSDR and want to know how to make the connections for it.

So my interest has been renewed on this and got involved actively in the integration.

So far it seems that USB2SDR and UHFSDR is a very well cooperating couple with control connections of I2C and Tx/GPIO being straighforward.
The other thing that remained to do was the PowerSDR-IQ modifications for it, so I did that too in the latest 1.19.3.20 (USB2SDR) version and got divider by two and a working extended bands setup 2m/4m/1.25m/70cm.

So now, I'm a happy user having USB2SDR and UHFSDR operating Rx and Tx from 1.7MHz to 470MHz and it is FUN INDEED !!

I do feel sorry that I did not have it built when I first received the kit some years back but at least now its really nice to have it working here and I do like it very much. :-)

One of the users, Serge RV3APM got me involved again in this so I have to thank him, I was a bit reluctant at first since my hands are full nowadays with the USB2SDR but it was certainly worth it
-> http://www.lampradio.net/USB2SDR.html

Dave, I think there is something that will bring UHFSDR to another level.
That something is the addition of a UHFSDR BPF for its receiver.
If you design a BPF with enough banks in octaves to cover the whole extended range and do that with I2C control, then UHFSDR will make a invaluable addition to any shack.
There are not many general coverage, up to UHF, transceivers (SDR capable) and I know that we are very near in having this right NOW !

So I'm just adding my bit here for any future directions that you have in mind.

73,
Christos SV1EIA

Pretty much the Mobo, less the driver and PA. It would make a nice fit
with the UHFSDR and the HiQSDR.

271. UHFSDR LowPassFilters connected to DBMs

Yahoo group: UHFSDR
Date: 2011-08-05 07:15:33 UTC
From: sv1eia
Topic: 271 Message: 271

Dave,

Do you have handy any values to double the passband, (increase the lowpass cuttof frequency) in the filters connected to the Minicircuits DBMs ?
I mean the two filters in C53,C54,C55,C56,C57,C58,L2,L3,R37,R38.

73,
Christos SV1EIA

272. Full Kit Status

Yahoo group: UHFSDR
Date: 2011-08-05 13:56:12 UTC
From: The Silver Fox
Topic: 238 Message: 272

After many weeks of being diverted in circles SiLabs has finally relented and given me a decent price on the Si570s. I am about to order ten of them for the kits and will email again once they accept and give me a potential delivery date. I think they are planning on six weeks.

Christos:
I don't have any values handy. Reducing the C's and L's would be needed. I think I designed it for a 50 KHz cutoff whic works for 48 KHz or 96 KHz sampling.

Yes, it looks like it, when in 192KHz sampling rate the band edges are attenuated so this filter bandwidth needs to be increased.

I'll see it with ELSIE and modify the values to increase the cutoff then.

Christos:
I think I used Elsie to design it. have been moving the grass the last
couple of weeks. My riding lawn mower broke down and have to use the push
mower. Will be done tomorrow. My neighbor cuts most of my 10 acres for hay.
But, last year I put in poles for an 80 meter 4-square and put down 12,000 feet
of radials on the ground. I don't want him getting his farm equipment tangled
in my radials, so now I have to mow that extra acre! Now it's done and I can
start putting up the verticals. The grass has covered the radials and I think I
only hit 2 or 3 and didn't cut any. Pretty good for 240 radials. I was too
lazy to bury all of them!

Yes. It is the same email. Please wait for me to announce the availability. If the Si570 order is solid, then there will be a small price reduction. I plan to announce it next week. Thanks for your interest.

Simon,

Sure. The current estimate is $66. This includes taxes, shipping, paypal costs, and mailing costs.

Hi Alan,

Can I place an order for the UHFSDR kit, or are they all committed? If it's possible, is it the same email as the mobokit orders?

Regards,

Andy G8DQE/VK2DQE

Alan, let me ask you again, you probably missed this question before,

Are you moving into a 'group-buy' direction or are you willing to have stock of the kits for future purchases?

I am ordering the Si570's to allow the production of Full Kits. I cannot afford to front the money for a larger order but I am willing to start a pipeline of availability for the Si570's. It is an issue of cash flow.

So, the game plan is to support a group of ten and then consider another round of ten depending on sales. If I sell enough to justify another purchase, then I will consider doing it. I hope this makes more sense of what I am up to and where I am in the process.

Dave,

I was under the impression that QSD is way better than the DBMs method.
So I tried to see the Two Tone close spaced (2KHz) IMD DR test, the one that Sherwood Eng. Labs use to sort the receiver's performance, on how well the UHFSDR can do.
To my surprise, UHFSDR achieved 85dB which ranks really high there.
The best number that I could get out of a homebrew QSD SDR rig was 87 dB.

And that 85 dB of UHFSDR is at a high frequency, 50MHz and above, whereas plain QSDs cannot go there with ease, if at all.
-> http://groups.yahoo.com/group/UHFSDR/files/SV1EIA/

Very nice surprise, good work Dave.

Mike, its not a QSD implementation as described in the Tayloe paper.
Although there are two quadrature signals, the two DBMs are not a QSD.
And they do need BPFs compared to simple LPFs in QSD Rx.

Yet, it seems that the design can cope well compared to other homebrew QSD rigs.

Thanks. My impression was that the QSD has less loss and, of course, uses very inexpensive components. But, I don't know of a QSD that works much above 100 MHz at a reasonable price.

Alan,

I am more than happy to pre-pay for a kit if that will increase batch size and improve access. It will add to your guaranteed orders, and if anything does go awry with the kits you can always do a paypal refund. If the softrock experience is any guide, you will be bombarded with kit orders!

Are you planning on including the PCB in the kits?

Regards,

Andy G8DQE/VK2DQE

Alan,

I was planing to pay in advance for the si570. I was just waiting for a full price. I can send $66 now, if you like, and more later if needed for unforeseen expenses. I want you to get paid for you efforts too. Let me know if you want me to proceed with this plan and sen money now or some other plan or just want to keep the order at 10 units for the kits you are doing.

Regards,
Eric Haskell

289. RE: [UHFSDR] Re: UHFSDR full kits

Yahoo group: UHFSDR
Date: 2011-08-08 00:46:09 UTC
From: The Silver Fox
Topic: 276 Message: 289

I have sold 30 full kits so far but have been discouraged with the criticism and apparent lack of interest from a group with so many members. However, until the demand is truly dead, I will continue to offer them as long as I can.

Prepayment does enable me to have more faith and more accurately gauge the demand. I do not want to nickel and dime the company providing the Si570's but they are so expensive I cannot buy more than a dozen at a time.

I appreciate any support in keeping the miniscule pipeline going. I will currently accept orders for the Si570s at $66 USD and full kits with PCB for $190 US and $194 DX.

Thanks and 73's

Alan,

Which model are you selling for the SI570. I will be interested if it is the one that goes to 1.4 Ghz.

Thank you for your good work,

This is what I am ordering. The chip covers the entire range of Si570 frequencies but check the specification for yourselves to ensure that it suits your needs.

dang, I think that's the nicest you can get for but decent price. if I had the money I would get another board in a heartbeat.
I'm still looking for a micro diaplexer that cuts around 480mhz .... there probably isn't one.

Yes. Paypal to my email address. Before you do, consider that it may be six weeks or more before I receive the chips for mailing.

I think the full kit idea is very cool. I'll buy one, and am happy to prepay. I'm still working on the board/partial kit, but could use a full kit.

299. USB2SDR/UHFSDR

Yahoo group: UHFSDR
Date: 2011-08-11 10:03:52 UTC
From: Jean Marie F6ETU
Topic: 299 Message: 299

Hello,

I wish to share with you my experience with the combination of USB2SDR / UHFSDR.
UHFSDR wiring, using the installation instructions and control is easy and quickly becomes a plaisir. J've used for testing the USB2SDR: Si570; for the test is working properly, use a cable as short as possible between both cards for the link I2c.
After a laborious handling of PowerSDR due to my English "Beginner", the use of USB2SDR with UHFSDR is simple and performance is outstanding.

73's Jean Marie,

F6ETU,

Kees:
The current board is UHFSDR_r1a. r1 added the extra inverter and header to select polarity of the rf switches, the a, I think(I didn't save the r1) changed one footprint.

303. Farnell CSV file

Yahoo group: UHFSDR
Date: 2011-08-14 05:58:25 UTC
From: brainerdd
Topic: 303 Message: 303

I uploaded a modified UHFSDR_BOM_Farnell.CSV file. In the last 3 months, Farnell discontinued 2 items and had to find replacements.
To use the file, download from the for sale page. Open in a text editor. Select the text and copy. On Farnell's UK site, you need to create an account and log in. You can then Paste the data there and it will be entered into the order basket.

Topic: 303 Message: 304

I compared the Digikey and UK Farnell files. Farnell did not have
8.87 ohm resisters for R31 to 34. You can use 10 ohm instead. The
mismatch in the 3dB pads will not be high enough to make any
difference(I used 10 ohm resisters on the prototype).
I also checked the Digikey file and all parts are still in stock.

305. UHFSDR Board Suggestions

Yahoo group: UHFSDR
Date: 2011-08-14 16:38:27 UTC
From: nwplouff
Topic: 305 Message: 305

Having just assembled a UHFSDR board, I am going to be so bold as to offer a few suggestions for improvement.

1. In the document package, provide a view of the board showing the orientation of all semiconductors and polarized capacitors.

2. If another PCB version is ever created, add pads for power supply leads with holes large enough for, say, 18 gauge wire. The holes for the 0.1 inch header strip are inadequate for wire leads.

3. By far the hardest part to solder was the CDSU101A diode. Consider substituting a larger part or increasing the clearance around the part.

After hearing scary stories about working with surface mount parts, and becoming a little fearful of screwing it up, for me, assembling the UHFSDR board turned out to be surprisingly straightforward. Tedious, but straightforward.

309. Si570 Purchase & Full Kit prices

Yahoo group: UHFSDR
Date: 2011-08-16 23:47:21 UTC
From: The Silver Fox
Topic: 309 Message: 309

Since I now have a more or less firm price for the Si570AAA000514DG I have to announce that the price has increased. The chip cost will now be $75. All orders to date will be honored at the previous price. They ended up being $10 more than I anticipated due to a new layer of bureaucracy in the order process. I am going to keep to the new price for the full kit until I have to restock. I expect to have to raise its price as well whenever that happens.

313. Power SDR Frequency coverage

Yahoo group: UHFSDR
Date: 2011-08-18 23:20:01 UTC
From: bob_bournemouth
Topic: 313 Message: 313

Hi All,
Just a quick question. I am going to build one of these brilliant kits, I have been playing around with Power SDR and have a question about the frequency coverage. The kit covers from 1.75 to 700mhz, however power sdr v 1.12.20 wont let me go above 52mhz.
How do you achieve the broadband coverage this board offers?
I have found that if I enable a transvertor for 144 mhz with an offset of zero I can enter frequencies in the 2M band, and also 433 etc if enabled as a transvertor.
How is it possible to have broadband receive over the range the kit covers?
Please can someone let me know. Obviously i only need TX on the ham bands but would like the option of the full coverage receive that this kit gives.
Many Thanks

Bob

Nothing stops the Si570 from covering its full range. However, the filters will either block the RF or degrade the incoming and outgoing signal. Someone else can specify if there are any other restraints. Note that the Si570 comes in many flavors and frequency coverage is one of the options.

For those interested in LF operation, Silicon Labs has the Si514
which covers .1 to 250MHz. Unfortunately, rather than having SDA and
SCL on the end pins like the Si570, they are on pins 1 and 2. This
would require a cut and reqire on the pcb.

Hi Bob,

Although it has passed quite some time and versions since I remember that this is configurable, what you refer to is the max frequency that PowerSDR-IQ can go.
That can be configured from PowerSDR-IQ setup here
-> Setup->General->Hardware Config->Si570->MaxFreq Hz

that field gets what is the Si570's device maximum frequency, so if you have a 1400MHz Si570 you should put there 1400000000
then by changing the VFO dial your frequency can go up to MaxFreq/Divider whereas Divider is always 2 for UHFSDR.

A P.S. to those who purchased the chips. They are being shipped in an envelope with little documentation. A warning for you. These are electrostatic sensitive chips so please use the normal precautions when opening the packaging.

From: Sid Boyce
Topic: 329 Message: 329

I was checking around my system and found a photo of the mounting of the jumper under the board and out of the way of top side components.
It's not my original photo, but it's how I've wired it on both of my UHFSDR's.
Thanks to the guy who shared the tip.
You'll find it under Photos --> G3VBV.

My kit came with a MMG3H21NT1.

Has anyone achieved the full 1.7-700 MHz frequency range?

What this the current preferred solution for providing wideband bias to this part?

Topic: 49 Message: 333

Eric:
The data sheet recommends supplying 5V with no dropping resister for
a bias of 90 ma. So, eith use a 7805 for U3 and 0 ohms for R2, or if
you want to use the 7808, then make R2 33 ohms.
I have gone above 450MHz, but not up to 700 MHz. I have also used it
on 80 and 160 meters. There are some holes in the 500-600 MHz region
due to the Si570 holes. The limitation on the frequency is the Si570.
The next limitation is the ECL flip flops. They are rated for a minimum
max clock freq of 4 GHZ. That would allow operation up to at least 2
GHz with a different LO. The lower limit is due to the Si570. The
lowest frequency they can be programmed to is about 3.5 MHz.

Now im abit confused .... the schematic i have L1 is a 560nH. I have aprox 56mW up to 54mhz.... from there my scope starts getting unreliable ...

Im not sure at this moment what is installed for L1 .... Maybe it was the 3.3uH ...

So does it mater which one is first in series when this change is made?

Mike:
The 3.3uH should be installed, otherwise the amp does not work below about 10 MHz. If both are used, order is not important. The 3.3uH works up through at least 2 meters and probably at 450 MHz. If you use a different part number, get the highest self resonant frequency(SRF) possible.

190 US 194 DX means $190 if sent to a USA address, $194 if sent to a non-USA address. If Chris is assembling it, then the kit will, I assume, be sent to Chris who is in the USA. You then make arrangements with Chris to send the completed kit to you.

Dave,

Does the $190 include everything needed to assemble the basic board? If not, what is needed to complete. Very interested in a kit.

Thanks,

Dave,

Does the $190 include everything needed to assemble the basic board? If not, what is needed to complete. Very interested in a kit.

346. PreAmp Parasitic Oscillations

Yahoo group: UHFSDR
Date: 2011-10-15 23:00:43 UTC
From: sv1eia
Topic: 346 Message: 346

Hi,

I've noticed some oscillations in my UHFSDR from the BGA612 in various frequencies.

Is there any idea on how at best to eliminate them?
I've decreased the preamp current with higher R3 resistance from 120 to 135 ohm (as mentioned in the BGA612 datasheet) and even higher to 180, yet the oscillations are still there.

Any thoughts are welcome.

73,
Christos SV1EIA

Christos:
I noticed that on one of the early units with the Hitite mmic at about 750 MHz. I think it only occurred in transmit when the output is open. I added a 100 ohm resister from the output of the mmic to ground. I didn't try a higher value.

I just took another look at the notes and the oscillation was on the transmit mmic, not the receive mmic.

Hello,
I noticed the same on the transmit MMIC a couple of days ago.
I use the UHFSDR for VHF+UHF so I choosed L1 as 560nH but it was
oscillating a lot around 40-50Mhz and then mixing with the RF output.
Finally I replace L1 with 100nH (closer to MMIC) + 4.7uH and it's clean
now under the transmit frequency and I only see the harmonics above.

Hi Dave,

Thanks for replying.

Finally managed to identify the cause of parasitic oscillations and it was not the BGA612 which is clean.
The mixing of a digital I/O ground to the BPF GND was giving a parasitic oscillation, removed after a ferrite bed inserted in that connection, so all is ok.

Now I can view the excellent 10m band conditions which is really fantastic, US stations come here in SV land at S9+10 or even more on a plain vertical, we waited for some years for the propagation to finally turn up and its worth it !!

Hi Christos,
I can't figure this one out. The ADUM51 separates them and the BPF connects to GND via the antenna connection J4.
Where exactly is the ferrite bead placed.
73 ... Sid.

Hi Sid,

Yes, the GPIO to BPF connection was the issue, if you want to control the BPF, on which band it will switch to, you should have three digital I/O lines and their ground (the ADuM is for the I2C that controls the Si570 frequency).

So the GPIO digital GND that comes from the cpu that provides the three control lines, has to connect on the GND of the BPF. When I placed a ferrrite bed there digital GND <-> BPF GND, a HZ1206C202R-10, the parasitic disturbance stoped.

Then the displayed spectrum got clear and I was able to gaze at the excellent 10m conditions today having a panoramic view :-)

Well I still don't know how to identify L1 visually, I figured I'll just replace what ever is there with a 3.3uH seriesd with a .56uH. I was surprised to see that the 56nH could be had for 6$ for 100 .... So ill sit and wait for the delivery as my punishment for misplacing my bag of unused parts.

Thanks, now I get the picture - the USBSDR is involved.

Hello Mike

No reason to sit and wait if you have a BN43-2402 or BN61-2402 in your junkbox.

3 turns on the BN43 or 6 turns on the BN61 make an excellent wide band choke as replacement for L1, if you keep the wire ends short. I use them with the ERA-5 and get a S21 spread of 2.5 dB from 2 to 500 MHz and less than 1dB from 5 to 500 MHz.

Keep in mind that in the UHFSDR, the coupling capacitors in the driver chain are only 10 nF (about 8 ohm at 2 MHz) so that you are better off with 100nF parallel to each of these if you want to go down to 1,8 MHz.

Finally, keep a look on U5 for oscillations. Compare the voltage across C14 in matched condition (with a 50 ohms resistor at the output) with the situation with a band pass connected to the output. If the voltage drops on connecting the band pass (absolutely required at frequencies below some 10 MHz) then U5 is most likely oscilating at quite high frequencies since it expects a load of 50 ohms over its bandwidth. A resistor across L1 or an attenuation pad at the input of the band pass in the transmission path may be helful.

BN43-2402 and BN61-2402 are binocular (two hole) cores widely used in softrocks.

I am afraid that the coupling between turns of toroids is to weak, but you might try.

Very impressive - a delightful buffet of flavors! Regrettably, my French ability is around zero. Is there information in English on some of your topics? The 'Bingo Star' is very interesting, but I found no paper describing it.

I use only Firefox for my internet browser. Is that a problem in accessing your site?

Thank you,

365. SDRWidget-i2c-UHFSDR

Yahoo group: UHFSDR
Date: 2011-10-18 21:34:47 UTC
From: Jack
Topic: 365 Message: 365

I have been trying to chase down a noise issue on the combo. If I run the UHFSDR under parallel port control, I have a great spectrum display using just the widget audio channels without i2c control. If I run the Widget/i2c control on a MOBO (SR63ng), I also see a great spectrum. However when I try to use the i2c control from the Widget on the UHFSDR, I have quite a hump at the center frequency (20-30 dB) : the frequency control works as its suppose to. I also hooked up an Arduino i2c controller to the UHFSDR with widget audio--again the frequency control works great but the hump is there.

At this point I believe this is attributable to the UHFSDR. Is anyone else experiencing noise associated with the i2c or thoughts on tracing the issue. I saw one post about a related issue, but they were not getting any control response. My setup controls the frequency quite well. Thanks and 73,
Jack (W0FNQ)

Jack,

At least with USB2SDR on a UHFSDR I see no issues at all with the I2C.
Actually since Dave placed an ADuM isolator there, I would be surprised to see anything like it.

If you altered though the circuitry and 'violated' the isolation by lets say feeding the outermost isolated side of ADuM from the UHFSDR power, then this could happen in your case.

Just my 2c.

73,
Christos SV1EIA

PS.
I had a small issue when cascading the 160m-10m BPF and its non-isolated grounding connecting to another digital-control ground but that got easily ok with a ferrite bed.
That of course has nothing to do with the UHFSDR.

Christos,

Thanks for the reply. I don't think the isolation is compromised based on VOM measurements, but I will pull the board out of its enclosure and do more checking around that chip. I am supplying the power to pin one of the UHFSDR from the Widget not the UHFSDR itself. Perhaps something has happened to the ADUM; I have considered ordering a replacement isolator. It is rather screwy that the parallel port configuration works so well.

369. Which way to jump

Date: 2011-10-19 15:19:59 UTC
From: John
Topic: 369 Message: 369

I'm just starting out with a new build of a UHFSDR.
I'm wondering what would be the simplest, least expensive interface for it to give it a try out. I don't have a computer with a parallel interface. Would it be possible to us Tony Park's old I2C board (for the 6.3) and somehow tell the software upstream about divide by 2?

Thanks,

John

Well I received my kit, and will be starting build for my Thanksgiving project. I have read most all of the posts on the forum, but if anyone has any last minute advice (with respect to build of course), it would be greatly appreciated.

Wish me luck, 73,

Hank

I would say .. double check what relays you have .... and the only problem I had in the build was a diode that's part of the Tx/Rx control .... it's cramped space there so put it on early and the resistor in series to ground ... its next to the edge ...

Gareth,

I am intimidated by the component size as well, but not probably smart enough to know when to quit. Thanks for the reply.

A pair of tweezers, a lighted desk magnifier, a soldering iron or soldering station with a very small tip and small solder (I use .015" 63/37 or 2% silver solder) make it easy with these size of SMC. Compared to some of the latest stuff(resistors .01 by .005 inch, IC's with .020 inch spacing, etc) these are large.

Still waiting for mine to arrive....i guess the revenue men have it....I also have the SDR2Go kit to put together....but I don't mind SMT in a way it is a lot easier than through hole technology. once you get use to the size. Removing leaded components from a through hole plated PCB is way harder than removing an SMT component.

You need a well lit area, a magnifier, something to hold the component to the board, some people use a toothpick for this. A small tipped iron and either some fine solder or some solder paste and some flux (which confusingly is called solder paste in many European countries). I like solder paste because it is easy to apply to the land on the PCB before you solder the joint. So you can then use one hand for the iron and the other hand to hold the component steady while you make the joint. If you are rich you can buy a hot air rework station instead of the iron....if you are poor you can try a hot air embossing tool from a craft shop. If this is your first time with SMT I recommend you get some scrap boards from an old PC and try removing and resoldering components to get confidence before you have a go at the real deal...

Regards,

Steve G0XAR

Hank:
.02" solder is probably OK. .032 is definitely too big. On the resistors and caps, put a little solder on one pad, hold the component in place with the tweezers and re-heat the solder. Then solder the other side and touch up the first side as necessary. Easier than it sounds. Likeways, on IC's put a little solder on one of the corner pads, position with the tweezers and re-heat the solder. Re-check the position of the IC and move if necessary. Solder the opposite corner. Again check the position. If OK, then solder the remaining pins. I find soldering these size surface mounts easier than thru hole devices.

Steve,

Thanks, I have wanted to try paste for a new build. I have used paste in past for rework. I do have a rework station, but unfortunately, I am far from rich.... :(It was a good price on e-bay! It has a pretty good iron and hot air tool so I think I am pretty set. Have done some SMT work before and this will be my 3rd time to mount a Si570 but I am still very cautious.

73,
Hank

385. Voltage Regulators U3-3

Yahoo group: UHFSDR
Date: 2011-11-25 03:19:09 UTC
From: Hank
Topic: 385 Message: 385

Dave,

In step 22 of the voltage regulators I verify 7.93V at U11-3 but without P2-1 to TP1 I am suppose to verify 0V at U3-3. I am seeing 7.93V at U3-3.

I see after I connect jumper from P2-1 to TP1 I am suppose to see voltage at U3-3.

Is this a problem?

not sure what you mean collector - emitter fail diode test?... diode junction is base - emitter ....

so, voltage on the base does change (q5) ?

sorry I don't have my Sdr2go to look at, but ill try to help if I can ...

Q5 looks like a pnp ... so when the base is relatively low (don't know what voltage but its not 5v - maybe 1.5v?), the emitter to collector will conduct.

if collector to emitter tests like a short ... well maybe its gone south ...

Mike,

Sorry should have been more specific. The collector/emitter junction conducts in one direction much like a diode which it should not conduct at all I believe.

It may be because I installed D1 early, there is a small voltage .5v going into Q6 which is probably allowing q5 to pass the 12V into U3.

I will keep testing tomorrow as it's well past my bedtime and can't think any more.

Good progress today, got through the Si570 and all except for this voltage issue on U3 seems well.

Mike,

I am going to drop worrying about Q5, tested it again and can not duplicate collector/emitter failure using a diode tester.

I am going to try to track down a parallel port pc tomorrow to test out setting of Si570 frequency.

Hank

Hank:
It could be a problem. U3 supplies voltage for the xmit mmic and we want it off during receive. When T1-1 is open, you should measured approx. 10K(R4) to ground. If that is OK, then try shorting P2-1 to P2-2. If you still see voltage at U3-3, then that indicates a problem in the Q5 - Q6 area.

Hank:
I don't think you would get enough voltage from D1. It is fed with a 220K resistor and there is a 10K to ground. Shorting P2-1 to P2-2 will ground the T/R line.

395. Parallel Port Frequency Control

Yahoo group: UHFSDR
Date: 2011-11-26 15:24:38 UTC
From: Hank
Topic: 395 Message: 395

Sorry finished day 2 of build and have another question...:(

I have installed Windows 7, 32bit on a computer with parallel port. Made cable to connect to H1 per instructions.

Pin H1-1 to DB25 pin 14
Pin H1-2 to DB25 pin 12/13/25
Pin H1-3 to DB25 pin 4
Pin H1-4 to DB25 pin 5

Can not set frequency with either SI570.EXE from PE1NNZ or DSS Parallel from WB8LGA.

Are there any gotcha's I may have overlooked. I am running both as Administrator.

Si570 seems fine but can not verify square wave as my scope only goes to 60Mhz and I think startup frequency is 514 as labeled on the chip. Also chip is labeled AAA so I belive it is the LVPECL and I have setup board as per instructions for this type.

I have 2.04V on TP8 and 2.03V on TP9 with DVM test.

Any suggestions?

73,
Hank
WZ3HMT

Topic: 395 Message: 396

After reading more posts, I found my startup frequency at 19.2Mhz which is well within my o-scope range, so I am not exactly sure why I can't verify the square wave. My DSO verify's the 19.2Mhz in the spectrum analyzer. I am sure it it something I am doing wrong but have moved on. I finished through the Transmit Op-Amps and everything except setting the Si570 frequency has worked. Surface mount has been much easier that I expected using both solder paste and 0.015 wire as suggested. I am going to try to get through receiver test today and hope that checks out as well.

Topic: 395 Message: 397

when doing Rx test .... don't be tricked into thinking something is wrong .... use a bandpass filter ..... I think even a tuner should work well enough for testing.

I had forgot that I had a bcbrs down the street (1 mile- KQNT) And was swamping everything .... I could hear stuff but nothing that would verify that it was working ok..... jumbled mess.

another heads up ..

Mike,

Thank you for the heads up. I plan on using a Si570 based frequency generator from K5BCQ I built. It works really nice and is an easy kit and great tool for around $40. After I verify it works I think I will hook it up to my antenna to see if I can hear anything. I have the BPF and LPF boards from Mike as well but not built. Those I am saving for Christmas!

Keep the suggestions coming.

My DSO verify's the 19.2Mhz in the spectrum analyzer. I am sure it it something I am doing wrong but have moved on. I finished through the Transmit Op-Amps and everything except setting the Si570 frequency has worked. Surface mount has been much easier that I expected using both solder paste and 0.015 wire as suggested. I am going to try to get through receiver test today and hope that checks out as well.

Subject: [UHFSDR] Re: Parallel Port Frequency Control

Mike,

Thank you for the heads up. I plan on using a Si570 based frequency generator from K5BCQ I built. It works really nice and is an easy kit and great tool for around $40. After I verify it works I think I will hook it up to my antenna to see if I can hear anything. I have the BPF and LPF boards from Mike as well but not built. Those I am saving for Christmas!

Keep the suggestions coming.

73,

Hank

Topic: 400 Message: 400

I was able to receive signals from both my signal generator and my dipole antenna. With the signal generator I tested 80M/40M/30M/20M all working fine. With my antenna I received signals on both 40M and 20M. I reconfigured my LPT port to the version that includes the band selection control with SDA/SCL on pins 2 and 16 and that seemed to allow me to control the Si570 frequency.

Thats enough excitement for today. I will test out transmit next but I have to order some more Molex 2 pin locking headers which I used in place of the supplied pin headers.

Kit is not bad at all for building and don't let the Surface Mount components keep you from building it. The board is layed out nicely and the suggestion to fit D1 in early should be added to the directions. Also maybe a note on paying attention to U9 orientation. During the testing I was checking pin 7 when I was suppose to be looking at pin 3. Once I realized the orientation, my tests worked fine. Probably would have caught that sooner but it was close to 1AM when I was making the tests.

Having lots of fun, thanks for a great kit Dave!

Just a heads up on problems if AS157's are used.

Alan says he only ships CSH210R but all I can find are AS157's, some I ordered separately and some that definitely came as part of one of the kits, probably the first one of the original kits from Art, KY1K.

I recently was prompted by Dave that the AS157's need a 10K from +5V to pin5 (per the datasheet), but no board space allows for them. The Assembly doc mentions AS157's.

I am only able to get RX to work.

In TX RF appears on pin5 but nothing on pin3.

The 10K's didn't do the trick and I haven't yet found the AS169's to try, but I have some more on order. All I can lay my hands on at present are the pesky AS157's.

I only remembered last night that I haven't seen the 1N5822's either, so they must be hiding in the same spot.

Made a mistake, pin 1/16 on DB25 were for SDA/SDL. That was the version listed in the LPT connections.pdf file. I could not get the LPT cable in the assembly manual to work with Si570.exe.

Anyway it works in PowerSDR-Iq with SDA/SDL on pin 1/16 on DB25 for sure.

Reading the datasheets, the AS169's are interchangeable with the HMC544,
so you should be OK. The AS157's seem to be the odd ones.

Sid,

Now I'm a little confused, the instructions show AS157 and AS169 using same H5-2 to H5-3 and shows different steps for testing than HMC544. . If the AS169 data sheet shows the AS169 are interchangeable with HMC544 wouldn't you think you would use the same pins on H5? HMC544 uses pins H5-1 to H5-2, and same tests. I plan to use removable jumper on H5 and hopefully will be able to figure this one out. I am stuck as my kit had 11 10K resistors and I am one short. I have an order into Digikey for that so I have to wait to test things out.

From: MIKE DURKIN
Topic: 254 Message: 408

im not 100% .... the pins might be the same
.. but polarity for no/nc (4&6) might be deferent ....

I had issues with rx tx .... but I eventually got it sorted out ...

Subject: [UHFSDR] Re: Strangeness with U2/U7

Sid,

Now I'm a little confused, the instructions show AS157 and AS169 using same H5-2 to H5-3 and shows different steps for testing than HMC544. . If the AS169 data sheet shows the AS169 are interchangeable with HMC544 wouldn't you think you would use the same pins on H5? HMC544 uses pins H5-1 to H5-2, and same tests. I plan to use removable jumper on H5 and hopefully will be able to figure this one out. I am stuck as my kit had 11 10K resistors and I am one short. I have an order into Digikey for that so I have to wait to test things out.

Sorry about the resistor count. I would have gladly sent you parts if you had let me know. I'll check my remaining stock for additional shortages.

They were OK before I installed the 10K's, so should still be.

It can be confusing.
That may indeed be a polarity issue, so here's what I got when using the
Assembly doc where the 10K's were not mentioned so were not included.
H5 1->2 RX OK, TX not OK.
H5 2->3 RX not OK, didn't try TX.

Looking at the data sheet truth table again.
The AS157 --- pin 4 High pin5 --> Pin1 (RX)
pin 6 High pin5 --> Pin3 (TX)
That means H5 2 -> 3 should be strapped.

I'll have to recheck those now the 10K's are installed.
73 ... Sid.

Alan,

Thank you for the offer. I should have asked first, but no big deail. Just one resistor off and I was substituting the included headers for a little better Molex connectors, keyed with a ridge lock for the connections from the UHFSDR board to the computer. Was placing the order anyway and it was less than $1 for 10 of the resistors, 9 will go into stock.

I should have thanked you also for the great kit. The way you have layed out the parts makes it easier build and can get started right away. With other kits I had to sort through components and believe me, there were more missing from those kits.

73,
Hank
WZ3HMT

413. U2/U7 AS169's fails some tests for T/R RF Switching

Yahoo group: UHFSDR
Date: 2011-12-01 02:56:43 UTC
From: Hank
Topic: 413 Message: 413

I have the AS169's in my kit and am at the T/R RF switching tests.

I have tried with H5 set to pin 2/3 as per instructions for AS169's but this config fails following steps
203. U7-5 to U7-1 continuity and has no continuity.
204. U7-5 to U7-3 no continuity and has continuity.
208. U7-6 suppose to be 3.0-5.0V and reads 0V
209. U7-4 suppose to be 0.0-0.5V and reads 5V
With P2-1 to 5V
212. no continuity between U7-5 and U7-1 and has continuity.
213. continuity between U7-5 and U7-3 and has no continuity.

I have also tried same tests with H5 set to pin 1/2 but this still fails the following tests.
201/201/209/210/211

Any recommendations?

73,
Hank
WZ3HMT

With H5-2 to 3 I forgot to say it also fails step
199/200 voltages at U7-6 and U7-4 are reversed.

Correction when H5-1 connected to H5-2. Follow tests fail.

201/202/206/207/210/211

When H5-2 connected to H5-3. Following test fail.

199/200/203/204/208/209/212/213

Fails fewer tests with H5-1 to H5-2 but not very reassuring.

Hank:
Try it with P2-1 shorted to P2-2(GND). That insures it is in receive
mode.

let's start with some thing basic for me... is H4 open or shorted?

Does U2/7 pins 4&6 swap high to low at tx/Rx?

the relays are not latching and I don't think there is a NO/NC condition.

what voltage is seen on t/rd during Tx &Rx?

Dave,

With P1-1 shorted to P1-2 tests 199/200/203/204 fail. With P1-1 to TP5 5V tests 208/209/213/213 fail.

This is with H5-2 connected to H5-3

Mike,

H4 is open.

Yes U2/U7 pins 4&6 Swap quite well.

I am not understanding where I am looking for t/rd, can you elaborate for me.

according to the schematic H5-1 is part of T/RD ... im wondering what voltage is Tx/Rx is.

ok ... usually H4 is open ... just a thought.

I ended up following the voltages through U6 ... I didn't have all pins soldered ...

Mike if you meant D1 during t/r. When P2-1 grounded to P2-2 D1 pm R67 side shows -.027v. When P2-1 to TP5 5V D1 on R67 side shows .09V

Mike I am looking at schematic too on RF_Amps.sch and I think you are refering to the T/R-> with an arrow not a D? With pins 2/3 on H5 jumpered, I have 5V on both pins. H5-1 has 0V.

Still a puzzle.
On 28/11/11 12:44, Sid Boyce wrote:

>
With 10K's installed to AS157's Pin 5 -> +5V. I can see definitely 157
marked on both and the datasheet suggests H5 2->3 is required.

H5 2->3 TX works, RX doesn't - I can see RF on the scope at the antenna.
H5 1->2 RX works, TX doesn't.

With H5 1->2

RX - U2-6 +5V U7-4 +5V
TX - U2-4 +5V U7-6 +5V

The inputs to the AS157's are toggling between RX and TX. If pin 6 is at
+5V, pin 4 is at 0V and vice versa.
I still haven't found my AS169's, so I may have to wait until the others
on order arrive.
I may have one more try at replacing with new AS157's I have to hand.

The real puzzle is that H5 1->2 works only for RX and H5 2->3 works only
for TX.
73 ... Sid.

Subject: [UHFSDR] Re: U2/U7 AS169's fails some tests for T/R RF Switching

Mike I am looking at schematic too on RF_Amps.sch and I think you are refering to the T/R-> with an arrow not a D? With pins 2/3 on H5 jumpered, I have 5V on both pins. H5-1 has 0V.

Hank

H4 can be either way. Shorted if you want separate receive and
transmit antennas. Open if you want a common antenna.

Hank:
Looking at the schematic and the instructions and a previous version of the instructions, it appears the instructions are in error. I remember I had a lot of trouble figuring that out. I will look at the data sheet for the AS169 and the schematic again. It it is the instructions, I will post a corrected version. I would have thought others would have caught that, unless they put it together without going thru the instruction manual.

im not sure if it was Alan or Dave that mentioned the manual being incorrect .... but I thought I would mention that I didn't quite follow the instructions too much as far as testing until it was completed. All that I tested during build was regulators and the Si570 for freq change .... the rest of my goofs were fixed post completion ...

Now I need to populate the header for programming the Pic to firmware 1.8...

429. Re: U2/U7 AS169's fails some tests for T/R RF Switching

Yahoo group: UHFSDR
Date: 2011-12-03 20:24:44 UTC
From: Hank
Topic: 413 Message: 429

I believe after running a bunch of tests with the AS169's and H5 in position 1/2 and 2/3, it seems that with the AS169's H5 should be in position 1/2.

When H5 is in position 2/3 transmit and receieve on TA/RA is reversed and T and R are both kept high in both transmit/receive.

When H5 is in position 1/2 transmit and receive on TA/RA are correct as well as T and R toggles with Pin 1 on P2.

This is after walking throught the schematic and tracing the voltages. I believe this is the correct configuration, maybe Dave you can verify for me.

73,
Hank
WZ3HMT

From: Dave
Topic: 413 Message: 430

Hank:
I think you have a problem on the board. Check to see if U6 pins
5,10 and 12 are +5VDC. If pins 10 and 13 are at 5VDC and the 74AC00 is
operating properly, it is impossible for R and T to both be high.
If T/R is ground, then with H5 2 and 3 connected U6 pins 2 and 9 will
be high. Since pin 10 is also high, then pins 8 and 13(R) will be low.
Pin 12 is +5V, so if pin 13 is low, then pin 11(T) will be High. This
will connect pins 1 and 5 of U2(which is the receive position).
If H6 is open, then U6-1 is High. With a ground on the T/R line and
H5 pins 2 and 3 connected, U6 pin 2 will also be High. This makes pins
3(RA) and 4 Low. Pin 5 is +5V, so pin 6(TA) will be High. This will
connect pin 3 to pin 5 of U 7(Receive position).
With +5V on the T/R line and H5 pin 2 connected to pin 3, a Low will
be on U6 pins 2 and 9. This causes a High on pins 3(RA) and pin 8(R).
With +5V on pins 5 and 13, pins 6(TA) and 11(T) will be Low. This puts
U7 and U2 into the transmit position.

Dave,

I must have made a mistake in my testing as I do not get T/R high at the same time when testing again this morning after reading your posting. I will run through it one more time to see where I went wrong.

Hank

432. Board Completed but ...U1 hot

Yahoo group: UHFSDR
Date: 2011-12-04 14:04:15 UTC
From: Oliver Goldenstein
Topic: 432 Message: 432

Hi All !

Completed my Kit yesterday and must say that the built was straight forward.

I had a bad solder joint on the ADUM1251, so that at the first time i
was not able to tune the SI570.

I have connected the UHFSDR to my SDR-Widget and it tunes fine now.

I get a bunch of Signals.

Only thing i notice is, that the U1 is very hot?

Oliver,

Congrats! U1 is hot for me also. Small heat sink until I get put into case. Having fun too!

73,
Hank

Ok, Hank, thanks fer the info. Good to know.

Thanks for all your posts the last week. Was quit helpful for me !

435. Re: [UHFSDR] Re: Board Completed but ...U1 hot

Yahoo group: UHFSDR
Date: 2011-12-04 17:39:35 UTC
From: Sid Boyce
Topic: 432 Message: 435

I moved U1 off the board, mounted it on to a 3 1/2" x 3 1/2" x 2"
heatsink that fits into an outboard 4" x 4" x 2" plastic box with a
small 2" x 2" extractor fan mounted at the back of the heatsink.

Instead of R1 I've substituted a 1N5822 schottky diode.
The metal case contains the UHFSDR, Widget with front panel mounted
Power switch, LCD, encoder, momentary switch for band changing, LED
Power indicator and on the backpanel power in, fuse holder, antenna
connector and a momentary push switch paralled off the Widget Reset
switch which I used to hold in until after power was switched on so the
Widget would come up in a proper state - no longer necessary since
Alex's recent firmware upgrade which introduced a Reset hold-off until
the voltage has settled.

There are also holes on the backpanel for audio leads and and the USB cable.

The whole unit is powered off my +13.8V main P.S and the Widget and
UHFSDR are both powered off U1, more current drawn and more heat that
needed to be got rid of.

That keeps it barely warm.
73 ... Sid.

That is normal is not heatsinked. You can either bolt it to a metal case or add a small heatsink.

Ok, thanks a lot Dave !

Enjoyed the built. Was quit fast this time :-)

Mhh where to look for good 6-Meter and 2-Meter BPF's?

Any Suggestions?

Many thanks 73 Oliver DL6KBG

Sid,

Dave is correct about Tasa's filters as a good suggestion. I have built the Genesis SDR previously to this and his design is amazing. If you just use his web site http://yu1lm.qrpradio.com he has BPF for 1.8/50/144mhz as well as some other SDR designs.

From my experience with the Genesis project, his designs really work well.

That's a site I've visited frequently for filter ideas. The most recent HF filters I quickly put together with a rotary switch for the HiQSDR came from the QRP2004 project where there is also one for 6m. The Yu1LM ones have more detailed performance data and are candidates for other than the quick lashup I needed.

From: jorge_macias33
Topic: 444 Message: 444

I have a question.
Have somebody succesfully used the UHFSDR device to download NOAA weather satellite images on the 136-138 Mhz band?

In the early hours yesterday I eventually found the AS169's in the box where I had looked a number of times but the small envelope with them had been hidden by the larger envelopes. In the afternoon the other lot I ordered arrived ... end of ramble.

I replaced the AS157's and the 10K pull-ups the datasheet calls for with AS169's and strapped H5 2--> 3.
Without any checks, I fired up the UHFSDR, RX worked, changed to TX and good clear audio received on the IC-7200.

With the 2 UHFSDR's all I could find were antistatic bags marked AS157 as part of the kits I got, guessing part of Art's stash. I would hazard a guess the AS157 datasheet is wrong and showing pinouts for the AS169 instead with the addition of 10K resistors to +5V on pin 5.

It would be a good idea to have reference to AS157 removed from the Assembly doc in case later as a result of a problem someone tries using them. I had already replaced the original AS157's with other AS157's.
73 ... Sid.

From: Hank
Topic: 254 Message: 446

Sid,

Thank you for your post. I am stuck on having no receive after installing AS169's. I will make sure to use pins 2/3 on H5 even though some of the tests from assembly manual fail. Dave posted that he remembered there were some descrepancies on the tests for U2/U7 logic and said he was going to re-visit the assembly guide.

I have control of the Si570 frequency and can watch it change on my scope as I change bands.

Everything was working up to the point I installed AS169's so I am not sure what is happening. Though I had it figured out but was wrong. Back to the test bench tomorrow, wish me luck.

Hank

Topic: 254 Message: 447

No problem Hank,
Hope you find the problem, the AS157's sure caused total confusion even after I thought I had it all figured out and correct.

I used a UBW with the first UHFSDR and I had to tune >14.3 KHz to get into the CW end of 20m. Alex issued a fix I never got to test as other problems cropped up.

Also with the first UHFSDR I had the free si570A samples, one channel failed after about a month with the UBW problem. I chased the wrong problem - working from the stereo plugs backwards and replacing components until I had no audio output and finally got to the si570 with both CLK+/- dead.

The second sample was DOA, then I got a spare sample from G1CET that was also DOA and finally I got a full spec one from George Boudreau that works.

May be towards the end SiLabs shipped out of spec devices as free samples.

Next came the AS157 RX/TX puzzle.
It's been a long slog, I reckon from Feb. 2010 until now though I have been busy with too many other projects while putting the UHFSDR to one side and just having the occasional brief look at it until now.

On 30th. Nov 2009 Art wrote:

Hittite has dismissed me with extreme prejudice and in fact, they sent an FBI agent and a Customs Agent to my home to investigate me, after stopping by my wife's place of employment to locate me. To this day, I still have no idea why they thought they would find me at her place of employment! I have no use for Hittite::>

On 1st. Dec 2009, Art wrote:
I cannot supply the HMC544. Instead, I supply the Digikey equiv chip (AS169-73LF), but it has inverted input lines. Dave's new PCB supports the HMC544 or any of the other industry standard chips (which have the input lines inverted relative to the HMC544). Let me know if you want the AS169-73LF instead.

I got AS157's in my kit.
73 ... Sid.

Sid,

I have the AS169's installed and with H5 in position 2/3, when in receive mode, receive is low and transmit is high which is reversed. This is what I get wiht H5 pin 2/3 jumppered when in receive mode.

U6 pin 1 high, pin 2 high, pin 3 low = RA low
U6 pin 9 high, pin 10 high, pin 8 low = R low
U6 pin 4 low, pin 5 high, pin 6 high = TA high
U6 pin 12 high, pin 13 low, pin 11 high = T high

If I put H5 in position 1/2, when in receive mode, receive is high and transmit is low. This is what I get

U6 pin 1 high, pin 2 low, pin 3 high = RA high
U6 pin 9 low, pin 10 high, pin 8 high = R high
U6 pin 4 high, pin 5 high, pin 6 low = TA low
U6 pin 12 high, pin 13 high, pin 11 low = T low

When pressing TUN in PowerSDR, with H5 in position 1/2, U6 pins 3/8 drop, dropping RA and R while U6 pins 6/11 go high enabling TA and T. I think this is correct.

If I move H5 to position 2/3 and press TUN in PowerSDR, U6 pins 3/8 go high, raising RA and R while U6 pins 6/11 go low disabling TA and T. This is exact opposite of what should happen isn't it?

That is what I am seeing when I test my board with AS169's and can not figure out how it would work with H5 in position 2/3 jumpered.

But then again I don't have a signal being decoded either way, so I am not sure what is really correct.

Hank

Sid,

Forget this last post, I just realized that the AS169's are probably low enabled inputs so that taking RA/R low would be in effect enabling Receive so having H5 to pins 2/3 would work.

It was your last post where you included Alan's comments about the AS169's being inverted inputs....I cannot supply the HMC544. Instead, I supply the Digikey equiv chip (AS169-73LF), but it has inverted input lines. Dave's new PCB supports the HMC544 or any of the other industry standard chips (which have the input lines inverted relative to the HMC544).

But I didn't catch it until 5 minutes after I had finished my testing and made my last post. Some times its better to just keep quiet and mull things over.

Late evenings and worse still in the early hours of the morning you can
get ever so muddled and miss the things that are staring at you.
Let us know how the rest of it goes. It's 05:32 and I'm heading off to
bed for about 7 hours sleep.

451. Got receive back but only left channel out of SPKR J1

Yahoo group: UHFSDR
Date: 2011-12-09 05:06:44 UTC
From: Hank
Topic: 451 Message: 451

Dave,

Was able to finally get receive working again, and am using H5 in positions 2/3 for AS169's.

I used my scope and followed all signals and found U8 pin 9 bad solder joint and same with R42. I love my Tektronix, would be lost without it.

Issue I am seeing now is that Receive I/Q going into U8 pins 4/5 fine but out on pin 14 seems off. Output on pin 11 and 5 seem fine. Not sure what to check or just replace U8 all together.

Any suggestions?

73,
Hank
WZ3HMT

On RX H2-pin 1 should be grounded to set U8 pin 1 Low.
The I_Aud and Q_Aud come in on pins 4 and 7 of U8 and ouput to pins 2
and 5 to the MMBT4401's emitters, then on to U10.

If you are using IQGEN.exe you should be able to trace the signals
through U10A and U10B to Line_IN_R and Line_IN_L.
Hope that helps.
73 ... Sid.

Sid,

Thanks, will check this evening when home from work but I am a little confused on H2 pin 1 to ground on RX. I though H2 pins 1/2 were tied together for a High OE Si570 all the time. Dosen't the Si570 still need to be enabled during RX for demodulation?

Hank and Sid:
That should be P2, not H2.

Dave,

Thanks, was going to ask that if it was P2. I am using Pin 8 on LPT port to toggle P2 from Low to Hi Rx/Tx. Is that not sufficient to ground U8 pin 1?

Hank

Using Pin 8 on LPT port does toggle U2/U7 correctly so I would assume it is workin for U8 pin 1 also.

Dave, Sid,

Thank you for your help, I am listening to the CQ Contest on 20M using the UHFSDR. On to build the BPF and figure out how to hook to my 50W amp. Then the real fun begins.

73,
Hank
WZ3HMT

which amp do you have?

The UHFSDR2GO only has 50mW drive ... I use a modified kitsandparts 10w amp .... it puts out 20w up to 17m them drops to 10W on 10m.(need to figure out why still)

Topic: 451 Message: 460

Mike,

I have two amps that I am going to work with. The first is with my Genesis G59, the GPA10. It is a 10W amp that takes 50mW input. I know the UHFSDR puts out close to 100mW so I am not sure if it will handle it. I also have Jim Veatch 50W amp from ARRL that I built and use on by Genesis from 10 to 160 meters. It works pretty good and I have been sucessfull on a complete homebrew Genesis G59 with this amp with phone QSO's to Japan and Serbia. Not many but it worked. I got 125 contacts with it on my first ARRL Sweeps this past November. I just finished the amp earlier this year.

73,
Hank

I didn't take a measurement but Dave reckons >100mW.

I'm just trying to figure out PA relay switching for my 15W.

I'll build up another of Alex's T/R Relay Driver for it using PTT_2.
Wondering if a level shifter is needed or if PTT_2 can be wired in directly.
73 ... Sid.

Excellent Hank,
I'll have to put an attenuator between the UHFSDR and the 15W PA. Once that is working, try the AN762 - 100+W which has LPF's used with a now defunct 200W PA.
Finally the EB104 at 3W in 300W out which is recommended by CCI for the LPF's in the EB104.
73 ... Sid.

From: Hank
Topic: 451 Message: 463

Sid,

Yes, I have Dave's BPF and MPLPF boards. I am ordering parts tonight for the BPF board and plan to build that over Christmas vacation. Probably should order parts for MPLPF's too. I was going to try to put the BPF board in line with the Genesis GPA10 amp and use the LPF's from the GPA10 along with the BPF from Dave. That should be interesting. I have to custom interface the band switching between the UHFSDR, the BPF, and the GPA10!

I was also thinking about trying to control the LOSC on the UHFSDR with an Arduino board using i2c and Arduino's WIRE library. Looks not too difficult. Also put a LCD on the Arduino and a rotary encoder to select the frequency just for fun to see where that might take me.

I really want to order either the SDRWIDGET or the USB2SDR but funds are low as I ordered a new mic (Audio Technica 2035) and a Alesis MIC Preamp w/Phantom Power. That is my Christmas present from the XYL. I am really looking forward to getting rid of my home built Radio Shack electret mic.

So it's just the parts to populate the BPF board for now and wait a while longer for my next project.

I am really happy I built the UHFSDR. It is definately a different approach than the Genesis. It is amazingly small compared the Genesis G59 for the same/more band coverage. One nice thing about the Genesis is the BPF for 6 to 160M are built into the radio. I wanted the UHFSDR to get into 2M and above. Genesis is now ceased sales of the G59 because the new kit the G11 is almost ready. It will be all SMD but not a kit. Mostly pre-assembled so I think I am going to pass on that one. If it was a kit like the UHFSDR I would scoop it up in a snap. Oh well, money still in my pocket.

Hank

Topic: 451 Message: 464

Hank,
I use the Widget with the UHFSDR. I think George may have just one kit left.
Ben Bibb (NO5K) on the AQRP group is using his UHFSDR/SDR2GO on 2m when
last I heard and that was may be over a year ago.

When I got home this evening I found my SR63ng/Mobo/Widget shut down
with a 70+ degree temp. A fault caused the PTT to come on permanently.
After it cooled down the temp is more normal ~27C but the PTT is still
permanently on.

I decided to try my UHFSDR/Widget with ghpsdr3 not long ago and it's
working. I thought I'd give it a try on the local network before putting
it on the internet tomorrow.
One problem I have to look at, since I replaced the AS157's with AS169's
the noise floor is ~-80dBm so I must have upset something unrelated.
73 ... Sid.

465. UHFSDR & MOBOKITS Tranciever package

Yahoo group: UHFSDR
Date: 2011-12-11 23:48:02 UTC
From: stacywilliams6908
Topic: 465 Message: 465

Hiya all

Firstly, I'm new to this group so please don't bite;)

Please would some one be kind enough to point me in the direction so that, I can build UHFSDR with MOBOKITS MOBO 4.3?

Are there any other boards/kits that I might need for a full build?

Regards & 73
M0WSA

frankly ... im not sure what's involved with a MOBOKIT , I use a UHFSDR2GO -- UHFSDR and a SDR2GO in a radio that had bandpass and lowpass filters already.

Hiya Mike

Funnily, Iv noticed BPF for the HF 1 to 30 MHz on the MOBOKITS and on WB6DHW sites, I would prefer the MOBOKITS BPF.

With regards to the LPF, this I have not seen but, they are not terribly difficult to make! At least in some cases.

I have see the SDR2GO site too

I hope to get back to the UHFSDR2GO soon. I built the SDR2GO and picked
my way through the configuration but stopped at the point of connecting
it to the UHFSDR, mainly through confusion about what some of the
displays were trying to tell me.
I hoped someone who had one working would produce a setup document like
the one I did for the Si570 Controller but got no takers.
Mike, I'd like some help when I get back to it if you would be so kind.
They would be short questions.

I have not so far modded the UHFSDR as described in Ben's notes.
73 ... Sid.

470. 70cm with Grade SI570 Grade B works

Yahoo group: UHFSDR
Date: 2011-12-14 21:18:13 UTC
From: Oliver Goldenstein
Topic: 470 Message: 470

Hi All !

Just want to let you know that i was a bit dissapointed when i noticed
that i orderdered a Grade B SI570 10-810 Mhz and later that there are
no SI570 Grade A to order anywhere.

Today i copied the local Digipeater at 438.300 MHZ loud and clear
whith a 2-Meter Turnstyle Antenna connected. No filter att all yet.
Was able to decode nearly every data Package monitored on the Channel.

With CFGSR.EXE i set maximum to 880 MHZ / 2 = 440 MHZ and that works.

Have fun, i have more and more with that nice little rig :-)

I am all out of SI570's for the UHFSDR kits. I would like to order another round but at the moment I am short on cash flow for this expensive investment. If there are folks out there that would like to pre-order some of the Si570's that I use in the kits or UHFSDR kits themselves, please paypal me at my email address. I need about ten to fifteen pre-orders of the Si570s to complete the purchase. The Si570's are 570AAA000514G which will cost $66 USD US and $68 DX. This price is contingent on the vendor honoring their quote and for pre-orders only.

472. Atom D525

Yahoo group: UHFSDR
Date: 2011-12-15 10:58:09 UTC
From: brainerdd
Topic: 472 Message: 472

Has anyone used the Atom D525 with PowerSDR-IQ? Newegg has a mini-ITX board with the D525 for $85. A 2 GByte RAM stick is $12.99.
Would be interesting to put the UHFSDR and filters in a 5-1/4 inch drive slot in one of the mini-itx desktop cases for a self-contained system at a reasonable price.

Dave - WB6DHW
<http://wb6dhw.com>

473. Re: Atom D525

Topic: 472 Message: 473

Dave,

It is an interesting proposition. If the RAM you are referring to is in a USB stick you need to be careful. Some USB ram sticks have a maximum life of 100,000 read writes. This sounds a lot but in reality if the operating system is doing a lot of memory read writes it can soon be used up....

Let us know how you get on....

Dave,

Got a HP mini 110 3617sa which has an Atom N550 dual core (close) you want me to try PowerSDR-IQ?

I would use with external usb Sound blaster 24 bit card.

Stephen:
The RAM I was referring to is DDR3 in a 204 pin package(Laptop RAM).
The board holds 2 sticks. It also has 7 USB 2.0 and 2 SATA plus
2-Serial ports, a parallel port and KBD and mouse ports plus video and
sound on board on a 6.75" square board.

Would be interesting. If you are using another SDR program, that
would be interesting as well to see how well that works.

In a discussion on the dttsp-linux list at the beginning of this year, one of the developers of the DTTSP signal processing core for PowerSDR, Frank Brickle, AB2KT, said that the development of that code was done on a 500mhz Pentium II with no GUI and it had adequate processing power.

I don't know how processor efficient the PowerSDR GUI is. The GUI I use on linux, sdr-shell, don't use much processor power.

I've looked at building a mini-ITX system with one of the D525 processors. I was going to use a Delta-44 card in it so I've tried finding a good case that has a slot for a PCI card but isn't too large. A case could cost as much as the motherboard.

For portable use, I found a DC-DC converter called the picoPSU-90 by mini-itx.com. I don't know how much RF all this will generate.

Hi Alex, Oliver,
:-)

There are two very good design resources for filters,
at first, its Elsie, distributed with the 2012 ARRL Handbook
-> http://tonnesoftware.com/elsie.html

and there is AADE, an also very good filter design application which is free
-> http://www.aade.com/filter32/download.htm

For switching the filters, you can use an RF relay or some pin diodes, you can get ideas from this very nice site
-> http://www.qsl.net/va3iul/Homebrew_RF_Circuit_Design_Ideas/PIN_RF_Switch_types.gif

488. DIY Isolated USB Cable

Yahoo group: UHFSDR
Date: 2011-12-23 10:15:38 UTC
From: Stephen Farthing
Topic: 488 Message: 488

Guys,

FYI
http://www.designspark.com/content/you-can-build-your-own-isolated-usb-cable

PS Design Spark is an on-line community sponsored by Radiospares one of the biggest European parts suppliers. If you join it you can get loads of free tools, including a FB PCB design package.

Hope this helps someone and that you all find some quality time to melt solder over the festive season...

I bought 2 USB isolators from Hong Kong some time ago but found the
Softrock would not enumerate through them.
I didn't put a scope on them to find out what the problem was, something
to check one day.

The circuit in this URL is blurred whatever viewer used so nothing can
be read.

2. I got a USB-Parallel cable but have never used it.

There are other options such as the UBW (Universal Bitwhacker) which
only needs a USB cable. It's a small board to assemble and needs only to
be flashed with firmware over USB.
http://groups.yahoo.com/group/softrock40/files/9V1AL/UBW%20Emulator/UBW-x2.hex

If you are using Dave's board then you can give it a try.

http://www.sparkfun.com/products/762 for UBW at $24.95.

I use a UHFSDR2GO (UHFSDR & SDR2GO)

With a Si570BBA, my 100mhz scope can see something to 500mhz... (fuzzes the trace with modulation)

So 1.8mhz to 440'ish isn't bad.... I can't tell about image rejection that high, I don't have a BPF for 2m or 440 yet hooked up..

I am preparing a 15W PA for the UHFSDR/SDR-Widget and minutes ago
finished building and checking the RX/TX switching for it.
At Some stage I'll get back to the SDR2GO setup (which is quite
involved) and connection to the other UHFSDR.

Mike, I think I mentioned before that I'll probably be asking you to
explain a few setup details I found confusing when I first went through it.

I think I completed the setup to just before connecting it to the
UHFSDR. I'll let you know when I tackle it again.

When completed, the firmware upgrade should be no problem as I have the
BDM programmer already connected to a PC.

All:

New to this list.

Contemplating UHFSDR as IF for my microwave
transverters. A couple of

basic questions:

1. What version(S) are people using with UHFSDR?

2. What experiences are people having using
USB-paralell to

control the UHFSDR? (The laptop I'll use has no
parallel port....)

Thanks, very 73, and Happy Holidays to all!

Jim

Jim,

On the parallel port, I was able to get it working with pin outs in the document LPT connections.pdf inside the UHFSDR Documentation folder on this forum. The small diagram plus the Si570.exe did not work for me. Also I was able to only get working on Windows 7 32bit. Windows 7 64bit I have not had any luck.

I am also runing PowerSDR-IQ V1.12.20. In the newer version 1.19.xxx I did not see the LPT port option.

I am leaning to buying the USB2SDR interface board but at 195 euros (240+ USD) I am hesitating although I am sure it's worth it.

There is also the SDRWidget which looks really interesting but as of now only supports 48Khz in Windows due to driver limitations, but at about $160US it is much more reasonable but not as capable as the USB2SDR..:(

I am also considering the Bitwacker or maybe putting together some code for an Arduino board. Either look fun but I am not sure how either will work with PowerSDR-IQ. My initial though would be not very well but I am not sure on that.

On the microwave I have no luck but I did have my UHFSDR running on 2 meters.

I have the parts for the BPF board Dave sells sitting next to me here on my radio bench. Starting that maybe Monday but it will be for 160-10M.

Good luck and Merry Christmas,

Hank

I posted one picture, I think it originally came from NO5K - I recently noticed it in his photos.
Before that I read a post that underneath was a better place to install the coax jumper, so that's the way I did it with the first kit from Art and the second one from Alan.
It certainly keeps it neatly out of the way of other components.

What were the real obstacles from Feb. 2010 until about 2 weeks ago were those DOA si570 samples - I had the first one fail after about a month and the other 2 were DOA - one I got from G1CET. Then those darn AS157's that I got with both kits. I know Alan got a stock of parts from Art on the handover, so that's how I got them with both kits - I found the original bags labelled AS157.

Strap H5 1-2 and RX worked but not TX, H5 2-3 TX worked but not RX. I replaced them with other AS157's and got the same symptoms.
I changed the FST switch, and the MMBT4401's, still the same. Latterly Dave said the AS157's needed 10K pull-ups on pin 5 (per the datasheet), no space on the board for them - no problem, but even with the 10K's wired in they still didn't work right.

Finally I replaced them with AS169's and everything works a treat.

The UBW works fine, that's how I ran mine before I got the SDR-Widget, it worked fine with my first SDR the SR v6.3 and Mobo v3.6.
The initial problem seen on the UHFSDR was with the UBW.hex (x4 multiplier) file which Alex corrected with the UBW-2.hex file. It emulates the DG8SAQ firmware, so is good with any Softrock program.
Simple, quick and easy to build and flash.
Merry Xmas to all.

Ok, it's the christmas season and im tired .... the sdr2go was actually straightforward ...., then I killed the pic and dsp with an accidentall rake across 12v with the encoder .... I still get a weird poping noise during Rx, tx seems fine ..... probably the sample dsp still, probably should buy a retail one ...

All rehash, the setup was easy.

I am preparing a 15W PA for
the UHFSDR/SDR-Widget and minutes ago finished
building and checking the RX/TX switching for it.

At Some stage I'll get back to the SDR2GO setup
(which is quite involved) and connection to the
other UHFSDR.

Mike, I think I mentioned before that I'll probably
be asking you to explain a few setup details I found
confusing when I first went through it.

I think I completed the setup to just before
connecting it to the UHFSDR. I'll let you know when
I tackle it again.

When completed, the firmware upgrade should be no
problem as I have the BDM programmer already
connected to a PC.

Hi All !

I hope you have or had a nice christmas !

I re read all the posts reagrding this topic and i do now realize, that i have the same error or misbehaviour.

I have the AS169 installed and have the same problem:

Strapped H5 1-2 i do have nice RX Signals but no transmit:

Strapped H5 2-3 i have no RX but have nice 100mW comming out on tx

To be honest i do not really understand what Sid's and Hank problem was. It is a bit confusing for me.

Please could you do a short summary where to look here.

Many thanks in advance!

Hmm it works for me if i left H5 completly open. Then i do have RX and TX.

Now that's odd ....

But if it works ...

Subject: Re: [UHFSDR] Re: Strangeness with U2/U7 - Success!

Hmm it works for me if i left H5 completly open. Then i do have RX and TX.

On 26 December 2011 14:39, Oliver Goldenstein <oliver.goldenstein@...> wrote:

Hi All !

I hope you have or had a nice christmas !

I re read all the posts reagrding this topic and i do now realize, that i have the same error or misbehaviour.

I have the AS169 installed and have the same problem:

Strapped H5 1-2 i do have nice RX Signals but no transmit:

Strapped H5 2-3 i have no RX but have nice 100mW comming out on tx

To be honest i do not really understand what Sid's and Hank problem was. It is a bit confusing for me.

Please could you do a short summary where to look here.

Many thanks in advance!

Sid,

Forget this last post, I just realized that the AS169's are probably low enabled inputs so that taking RA/R low would be in effect enabling Receive so having H5 to pins 2/3 would work.

It was your last post where you included Alan's comments about the AS169's being inverted inputs....I cannot supply the HMC544. Instead, I supply the Digikey equiv chip (AS169-73LF), but it has inverted input lines. Dave's new PCB supports the HMC544 or any of the other industry standard chips (which have the input lines inverted relative to the HMC544).

But I didn't catch it until 5 minutes after I had finished my testing and made my last post. Some times its better to just keep quiet and mull things over.

Topic: 254 Message: 505

Oliver,

Merry Christmas. The problem I was having was that I could not verify all the tests in the build instructions, so I decided to trace out the logic based upon the schematic. I was able to verify, after realizing that the AS169's were low input enabled, that having H5 in position 2/3 works for the AS169's even though a couple of the tests listed in the assembly manual had failed, so don't get to worked up on that. Dave said he would go back through his notes as he recalls some inconsistencies in the instructions with regard to these tests. I have not seen this update yet, but I assure you that my Rx/Tx switching works fine with AS169's and H5 in positions 2/3.

73,
Hank

Hi Mike, Hank and Sid, thanks for your replies:

yes it works have H5 completly open and nice RX and full TX 100 mW out with
that configuration.

With H5 2-3 i get only TX and with H5 1-2 only RX.

For a start, remove the reference to AS157's.
I found some tests didn't work as written so I used the circuit diagram
to work out what should happen and though the AS157's seemed to be doing
what was needed I couldn't get RX/TX to work, just one or the other
depending on H5 strapping.

Having replaced them with other AS157's RX/TX wouldn't work.
The AS169's with H5 2-3 strapped works.
73 ... Sid.

509. UHFSDR TX Test with QtRadio

Yahoo group: UHFSDR
Date: 2011-12-26 19:16:19 UTC
From: Oliver Goldenstein
Topic: 509 Message: 509

OK, i needed a little success story on the last holiday :-)

Finally i got RX/TX switching on the UHFSDR working.

Next is the Amplifier and a case when the widget arrived.

Happy Holidays:

That was well spotted Oliver and one combination I didn't try.

I'm all wired up to test the 15W PA using Larry's PTT circuit, Alex's PA switching/bypass relay sequencing circuit and taking the PA /PTT from H5 using an open jumper with with a wire soldered to the exposed cross bar.
73 ... Sid.

thanks Sid !

Bit isnt it confusing. but it works :-)

Dave please respond, so that others are not confused !

Merry X-Mas

Oliver

512. UHFSDR 70cm with Grade B SI570 Tests

Yahoo group: UHFSDR
Date: 2011-12-29 21:01:37 UTC
From: Oliver Goldenstein
Topic: 512 Message: 512

Hi All!

You may now i am a bit a nursery's child :-)

I do still a lot of Experiments with my UHFSDR which performs very
well and locally even without BPF's and a Preamp so far.

I definitely want to go on 70cm with my UHFSDR to receive Satellite Signals.

The first results you can see here, what is possible to do with a
UHFSDR and a Grade B SI570 (up to 810 MHZ /2 = 405 MHZ normally).

My Grade B SI570 works very well up to 440 MHZ.

I was not on 70cm for years and to be honest i am impressed about the
technical capabilities of modern Repeaters.

But have a look. UHFSDR with no BPF and a 2m/70cm Vertical on the balcony:

http://www.youtube.com/watch?v=5qr9rmz0OSo

Future Tasks:

The next is to build a filter for 2-Meter. The parts are already in
and the design is from here:

http://yu1lm.qrpradio.com/2m%20BP%20FILTER-YU1LM.pdf.

and i ordered a LNA/BPF for 70cm from Roberto DG0VE just around the corner:

http://www.dg0ve.de/LNA70_1_2010_001.pdf

So stay tuned.

73 de Oliver DL6KBG and to all a happy and successful new year

Probably devices that do not make A grade spec are classified as B grade
and ones that don't make B grade are classified as C grade.
I just did a quick and dirty test setting an Ensemble rxtx with a C
grade si570 to 90Mhz. It set and read back OK but I would have to remove
it from its enclosure to have a look with scope and frequency meter.
73 ... Sid.

Iv wondered if a Ole mitrek might be a good candidate for the bandpass AND PA .....

Any thoughts .... I really wonder about SSB linearity .... but im gona give it a "ham" try anyways ....

515. UHFSDR Spectrum at Center high level

Yahoo group: UHFSDR
Date: 2012-01-01 19:05:46 UTC
From: Oliver Goldenstein
Topic: 515 Message: 515
Attachments: 1 described; binary payloads are missing from this source WARC

HI All !

Please see the attached picture. I operate the UHFSDR some time and yesterday i received my sdr-widget.

The "hill" in the center is with every soundcard i tried. because of that the sdr-widget is very sensitiv, the hill is higher than with other soundcards.

What is wrong with my UHFSDR?

This is a question unrelated to your problem ...

Did you remove the lowpass filter of the UHFSDR? I don't remember the rolloff freq but maybe that's what your seeing?

Hi Oliver

Could be a ground loop. Disconnect the antenna and or the TX I /Q and see
if it goes away.

Larry W9AMR

Hi Larry and Mike !

Larry i did the following:

disconnected tx i/q = same picture as posted

disconnectet ground from rx i/q = same picture as posted

disconnected antenna = same picture as posted

running out of a gel cell battery.

Runnning only one wire without ground to the widget picture as attached.

I will have a look at the fresh received widget.

Diversity? I don't think so ...
Just separate Rx and Tx antenna or common Rx/Tx antenna ....

I could be wrong but I don't think so..

Mathison:
Mike is correct. You can have either a common Rx/Tx antenna or
separate Rx and Tx antennas.

H4 OPEN = Common Antenna at J4. H4 SHORTED = Separate antennas. TP4
is receive, TP5 is transmit. The RX is never connected to the TX power
output. With the common antenna, U2 and U7 do the switching.

Mathisono:
J5 is for an external oscillator to use in place of the Si570. You can also take output from the Si570 at J5. That was put in for those wanting to use the UHFSDR for 1296 or 2300 MHz or 3300(the upper 2 might require a different mixer).

Dave:
Quick question: As I converge toward ordering a kit, I'd eventually
like a USB interface, and 192 KHZ sample rate to get the bandwidth.
(This will be IF for my microwave xverters.
Reading an old description file, I see that there is a 50 KHz low pass
filter downstream of the receive mixers. Presumably, this would limit
response and bandwidth, rendering 192 KHz sample rate moot, in terms of
bandwidth. Is this correct, or has something changed, or do I just not
understand something?

Second question, since I will use this on the road with my laptop: Doe
the Cypress USB drivers as modified work with Windows7?

Thanks & very 73,
Jim

I don't know what happened on the email. I got other messages today
with that address. For a 192 KHz A/D, the LPF after the mixers should
be raised to 100 KHz.

From: Oliver Goldenstein
Topic: 530 Message: 530

Hi All !

I wanted to proof, that that works. It does :-)

All done with hombrewed rigs and open source tools. By the way the frequency tracking done by gpredict in interaction with QtRadio works perfect.

Hi Alex !

Best chance is for Satellites with CW Beacons like:

HO-68
CO-65
Swisscube
Itupsat

received so far...but there are more.

Good luck... much appreciate to see a Video from far East :-)

Good Night

Oliver DL6KBG

Subject: [UHFSDR] For Sale: UHFSDR PCB, Mini-Kit, complete remainder of BOM from Digikey, NO SI570

I purchased this back in April 2011 and just can't seem to find the time to put it together.

The kit is complete MINUS the SI570. It has the UHFSDR-r1a PCB, the mini-kit of parts as provided via:

http://wb6dhw.com/For_Sale.html#UHFSDR

I also ordered all the parts from the Build of Materials from Digikey which are included.

NOTE: The SI570 IS NOT INCLUDED.

I hope this provides someone with more time to get a jump start on a really neat project.

I'm asking $80 and cost for 1st class shipping depending on your location.

From: Sid Boyce
Topic: 49 Message: 541

TX was working fine at 100mW.

I added a 15W PA (50 ohm in/out) and saw it go into oscillation with low output.
When I tried again barefoot the HMC482 gave no output.

I have a supply of HMC482's on hand.
Next time I try I shall insert a 3dB pad to see if that cures the problem.

What say Dave?

Sid:
I think a 3dB pad would help. The mmics are 50 ohm output impedance
and operate well into the GHz range. Even though the 15W amp may be 50
ohms at the operating frequency, it may not be at the harmonics which
are present at the UHFSDR.
What amps are others using and what are your results. I am working
on a 100W amp to go with the UHFSDR, but have not yet connected it.

544. MPLPF

Yahoo group: UHFSDR
Date: 2012-01-30 02:28:34 UTC
From: brainerdd
Topic: 250 Message: 544

I just ordered 100 production boards for the MPLPF. The MPLPF is a 100W low pass filter board. The boards are 3" by 7.25 inches. They contain 7 5 pole low pass filters and have extra holes for parallel capacitors. They will work for elliptical filters as well as Butterworth filters. Relays are used for switching. Control can be either by I2C or via an external rotary switch. The boards are designed for T-50 toroids and should handle 100 watts easily.
I will be moving the description from the "Under Development page to the "For Sale" page in the next couple of days plus including a photo and assembly instructions.

From: sv1eia
Topic: 538 Message: 551

Hi Dave,

Just to report on your request.
It looks that about 20% of USB2SDR users using it for their UHFSDR.
In PowerSDR-IQ there are quite a few additions for UHFSDR like FM Wide/Narrow and CTCSS for repeaters with native frequency support on VHF and UHF bands, also provisions to configure the frequencies of a switchable 8-band filter either as BPF or LPF.

Eric KC5YOE has a nice success story here
"UHFSDR + USB2SDR = Flexible IF Rig"
"North Texas Microwave Society, KC5YOE's Talk on SDR IF Radios"
http://ntms.org/files/KC4YOE_UHFSDR-USB2SDR.pdf

73,
Christos SV1EIA

Topic: 49 Message: 554

I do Larry,
UHFSDR --> RX/TX BPF's --> 15W PA -->50 ohm dummy load was the test setup.

The 15W PA is from an earlier HF transceiver project that drove a 200W solid state PA for a number of years and was tested into a dummy load with input from a signal generator before connecting it to the UHFSDR and for relay sequencing I used Alex's circuit which was very similar to the one I used with the 200W PA in the original transceiver.

At 100mW UHFSDR --> RX/TX BPF's --> Lightning Bolt Quad antenna.
73 ... Sid.

Join the club Mike,
My first is sitting on the shelf waiting to be hooked up to another
SDR-Widget and put in a case. It's fully working.

I used the second one for troubleshooting the RX/TX switching problem
which turned out to be with the AS157's. Once that was sorted with the
AS169's it went into a case with the Widget with a small external 13.8V
-> 5V P.S using a 5A LM338T on a fan cooled large heatsink replacing the
on board LM7805 and also supplying +5V to the SDR-Widget.
73 ... Sid.

Homebrewed ones from the QRP2000 project design with T37 and T50 cores
with SM caps.
They were built and used with the HiQSDR and swapped across to the UHFSDR.

The HiQSDR is soon to have it's own native preselector board with
everything for RX and TX including a 10W PA ready to go on 160m - 6m.
Right now it's on the internet without filters so guys can access it
remotely and tune all bands using QtRadio.
73 ... Sid.

Any one using the bandpass filters from wb6dhw?

Different type of filter uses escapes me for the moment.... ie why use one over the other type.... cheb instead of elliptic ..

Subject: Re: [UHFSDR] TX driver

I do Larry,

UHFSDR --> RX/TX BPF's --> 15W PA -->50 ohm dummy load was
the test setup.

The 15W PA is from an earlier HF transceiver project that drove a
200W solid state PA for a number of years and was tested into a
dummy load with input from a signal generator before connecting it
to the UHFSDR and for relay sequencing I used Alex's circuit which
was very similar to the one I used with the 200W PA in the original
transceiver.

At 100mW UHFSDR --> RX/TX BPF's --> Lightning Bolt Quad
antenna.

73 ... Sid.

Hi Sid

Are you running a BPF after the UHFSDR?

In a message dated 1/29/2012 8:07:36 P.M. Eastern
Standard Time, sboyce@... writes:

TX was working fine at 100mW.

I added a 15W PA (50 ohm in/out) and saw it go
into oscillation with low output.

When I tried again barefoot the HMC482 gave no
output.

I have a supply of HMC482's on hand.

Next time I try I shall insert a 3dB pad to see
if that cures the problem.

What say Dave?

73 ... Sid.

On 30/01/11 05:33, Dave - WB6DHW wrote:

Rainer:

You are correct. The impedance of L1 becomes
too low at low frequency.

Either or both of the following work:

Replace L1 with a 3.3 uH

Remove C12,C13,C14.

If you plan on using the UHFSDR both at 450
MHz and 80 or 160 Meters, the

inductor at L1 must still have a good RF
impedance at 450 MHz(ie the self

resonance frequency needs to be in the VHF
range). Yaesu, in the FT8X7 designs

that have a 5W amp that covers from 160M
thru 450 MHz use 2 inductors in series

- a 10 uH for low frequencies and something
under .1 uH for VHF/UHF where the 10

uH looks like a capacitor.

No, but I do use a BPF that's original to the radio its in ..... an Atlas350XL. Its variable with what seems like steep skirts and is in between the PA & UHFSDR.

Subject: Re: [UHFSDR] TX driver

Sid:

I think a 3dB pad would help. The mmics are 50
ohm output impedance and operate well into the GHz
range. Even though the 15W amp may be 50 ohms at
the operating frequency, it may not be at the
harmonics which are present at the UHFSDR.

What amps are others using and what are your
results. I am working on a 100W amp to go with the
UHFSDR, but have not yet connected it.

Hi Jim

Info on the widget can be found here. _http://mobokits.stormwarning.org/_ (http://mobokits.stormwarning.org/)

There is a yahoo news group for PSDR. You can Google it. I use V1.12 with WinXP. There are many versions. If your wanting to do voice PSDR is probably the best windows program. I am a newbie to Linux. Others can recommend software for that. The Wiidget works with both OS's and I believe there are a few that are running it under Mac. I have not had great luck with Win7 yet.

Dave ,

Are you thinking what I am thinking?

That spare area on the PCB for a USB interface based on the Softrock ctt with the Tiny IC and PTT isolator ?

I may well try it out in the next few days.

I know others have done that already because I asked that very question a few months ago. I have an unbuild USb/I2C softrock interface board kit waiting in the wings for my yet to be build UHFSDR.

From: The Silver Fox
Topic: 574 Message: 574

Surprise! The Si570s for the kits have arrived. Paypal monies to my email address for the kits. $194 DX and $190 US. Si570 alone is $75.

Subject: [MOBOKITS] Re: Howling wind subsided

I made a few measurements and tests with the second 6.3/MoBo I built
and I remember disconnecting the I2c from the SR6.3 the Sis570
carried on at the previously programmed Hz and a lot of the noise
and a few of the artifacts were missing. Other of the noise
on 20m no antenna were reduced. I had meant to put some beads
and bypasses on the I2c line but the OM I built it for was in a hurry.
Since I will be using the USB2SDR in my own rig I will be
experimenting
with that. At this time I am using an FA-66 but I am to rebuild the
"box"
and incorporate the USB2SDR. Testing with the USB2SDR bread-boarded
showed good results but with low HZ pick up by the USB2SDR.
I will have to screen this unit when installed and I will then be
looking seriously
at noise abatement.

Best Regards 73 Eric VK5ZAG

The current qty 1 price for the Si570 from the Si Labs website is
$98! That's a very good discount.

Jim:
The only time I have used it above 450 MHz was to listen to a TV translator audio. Seemed to work OK. I think it was CH 48.
The Si570 noise is naturally worse the higher the freq., but still good enough for a high freq IF. The Si570 does drift somewhat with temp changes. That may be where that comment comes from. Non-50 ohm termination of the 2 mmics might cause oscillations or other problems.
The DBm's are sensitive to the odd harmonics, so a cell phone at 1.8 GHz could cause interference if the LO is near 600 MHz. Wifi at 2.4 GHz could cause interference if the LO is near 480MHz. The solution, of course, is a BPF on the input.

The 570 that I am selling with the kits is AAA. There is one better grade
but it is VERY expensive.

Dave:
Thanks.
I will probably do things to temp stabilize the Si570 and the whole board.
I plan to do the BPF at RF and diplexers downstream of the mixers.
Hopefully that will take care of the odd harmonics, etc.

Good performance at CH 48 (680 MHz) would exceed my nees.

Thanks & 73,
Jim

MIke:
I will download the Digikey BOM's and post them. Then you can just upload them into the BOM maker on Digikey.
Digikey changed their BOM maker 2 or 3 years ago. Apparantly only those with the login ID of the creater can access the BOM even though it says "Public". I will have to ask Digikey about that.

597. Re: Individual Digi-Key order

Yahoo group: UHFSDR
Date: 2012-02-03 04:26:23 UTC
From: Dave
Topic: 251 Message: 597

I just had an online chat with Digikey. Seems you have to have the same customer # to have access to the BOM. I am not going to give out my customer #. She said she would get back to me tomorrow. Seems stupid to me. I pointed out there are 10's to 100's of thousands of experimenters and hams out there. I also added that Mouser has true public BOMs.
In the meantime, I will download the BOM and post it as a XLS file that can be re-uploaded to Digikey. Don't think they thought that people sell PCB's and partial kits and want their customers to easily be able to order the parts from Digikey. Seems that would be a win for Digikey and for use who sell PCB's and partial kits.

The best supplier I know of for torroids and related items is at
https://www.amidoncorp.com

When a BPF was build with toroids it had lower loss than the smd
toroids. So, the Q must have been higher.

The smd version has 4.5 to 6 dB of loss. I did not build a toroid version. But, I found a document from R. Meyers who redesigned the filters to be 5 pole using T25 toroids. He measured 1 to 2 dB of loss. I think someone else also built a toroid version of my design.

Topic: 613 Message: 613

I just uploaded a .xls file that can be uploaded to arrownac.com to create a BOM. You have to create a free My Arrow account. This BOM includes all but the toroids, relays and PCB. Unfortunately, arroweurope.com apparently does not carry mica capacitors.
I looked at Farnell. But, their prices for micas are several times that of Arrow. Plus they didn't have the 3.9nF and the 51pf in mica.
The relays are available at futureelectronics.com for $1.45 each. Toroids are available from kitsandparts.com or amidon.
I am looking at putting together a kit of parts. Price for all parts including PCB would be around $80. Let me know if interested. I receive parts from arrow and future in less thasn a week.

Are there turns data for toroids from K&Parts?

Id surely want 1.5db loss compared to 6db. Even if I did use a deferent T1 that was specd to 900mgz....

The 5 pole .doc file has the number of turns for the T25 toroids.
It is in the BPF directory at

<http://f1.grp.yahoofs.com/v1/QDEwT21ZSFubXfetGyoUGdRm3xkVWO4OW0INbI0KJlATK94wNwNwG187mqjY3iTLtpw6ul9Csgj3mtMAmzA1tA/BPF/Bandpass%20Filter%20Toroid%20Design-5%20Pole.doc>

HI Ed !

I built this here:

http://wb5rvz.com/sdr/usb_i2c/

but you need a programmed AVR maybe from a Softrock project

Good Luck

Haven't finished my UHFSDR yet, but I have built up a simple control board using the code from here: https://code.google.com/p/usbavrsi570/ and the simple schematic (modified to run on 3.3V so it doesn't need zeners on the USB) from the Softrock which can be found here: http://www.wb5rvz.com/sdr/ensemble_rx_ii/ . It's about 4 parts plus the ATtiny (which you will need to program...)

USB supplies 5V power, however the signal lines are supposed to be 3.3V. In the Softrock schematic I linked to, the ATtiny runs on 5V, and Zeners D1 and D2 are used to clamp the USB data lines to 3.3V to satisfy the specification (3.6V is also acceptable). If the ATtiny is instead run directly on 3.3V, these zeners are unnecessary as its outputs will naturally be 3.3V. However, technically this is overclocking the ATtiny as it's only specified for ~13MHz with a 3.3V supply and we're using it at 16.5MHz. It works for me, and I've never had trouble running AVRs at their full clock speed on 3.3V but YMMV, it's outside the specs. I've only done it because I don't have the 3.3V zeners on hand and needed something to build before my Si750 arrives. ADuM1251 on the UHFSDR can work at 3.3V or 5V just fine, so I'd suggest using the circuit as written, you also shouldn't need a regulator either in that case.

I wasn't aware of that one, basically the same thing but missing the necessary I2C pull-up resistors and with a bit of a different setup for the aux outputs. I also have only included one optoisolator for PTT. My original plan was actually to use this project: http://www.harbaum.org/till/i2c_tiny_usb/index.shtml which is completely unrelated to ham radio, and write the computer interface part myself (which I will probably have to do anyway since I use Linux mostly for radio stuff). Finding the usbavrsi570 project and realizing it will work almost perfectly for UHFSDR was a very nice surprise.

It works for me, and I've never had trouble running AVRs at their full clock speed on 3.3V but YMMV, it's outside the specs. I've only done it because I don't have the 3.3V zeners on hand and needed something to build before my Si750 arrives. ADuM1251 on the UHFSDR can work at 3.3V or 5V just fine, so I'd suggest using the circuit as written, you also won't need a regulator either in that case, as they

have done in the Softrock (I used one to get my 3.3V supply).

If you'd like I can draw up a schematic of a minimal design suitable for UHFSDR.

Hi Ed,

If you want to have a simplistic approach, then, PowerSDR-IQ can utilize via LPT the I2C for UHFSDR's Si570, provided that you do have a LPT available.

If you really need though a USB low cost solution that works with the current sdr applications, then you can have a look also at these

Christos,

Thanks for the info. I have no LPT available, hence the desire for USB.
The 2 solutions which you propose are workable, but I would have to leave many of the parts off the PCB. They do have the advantage of the USB connector and PCB.

I just uploaded a
.xls file that can be uploaded to
arrownac.com to create a BOM. You have
to create a free My Arrow account. This
BOM includes all but the toroids, relays
and PCB. Unfortunately, arroweurope.com
apparently does not carry mica
capacitors.

I looked at Farnell. But, their prices
for micas are several times that of
Arrow. Plus they didn't have the 3.9nF
and the 51pf in mica.

The relays are available at
futureelectronics.com for $1.45 each.
Toroids are available from
kitsandparts.com or amidon.

I am looking at putting together a kit
of parts. Price for all parts including
PCB would be around $80. Let me know if
interested. I receive parts from arrow
and future in less thasn a week.

Subject: [UHFSDR] MPLPF parts

I just
uploaded a .xls file that
can be uploaded to
arrownac.com to create a
BOM. You have to create a
free My Arrow account. This
BOM includes all but the
toroids, relays and PCB.
Unfortunately,
arroweurope.com apparently
does not carry mica
capacitors.

I looked at Farnell. But,
their prices for micas are

several times that of Arrow.
Plus they didn't have the
3.9nF and the 51pf in mica.

The relays are available at
futureelectronics.com for
$1.45 each. Toroids are
available from
kitsandparts.com or amidon.

I am looking at putting
together a kit of parts.
Price for all parts
including PCB would be
around $80. Let me know if
interested. I receive parts
from arrow and future in
less thasn a week.

635. UHFSDR 144 Mhz, 432 Mhz MDS Results.

Yahoo group: UHFSDR
Date: 2012-02-09 20:02:16 UTC
From: Ed
Topic: 635 Message: 635

Hi All,

I decided to do a measurement of the MDS of the UHFSDR on 144 Mhz and 432 Mhz. The following results were observed :- -145dbm on both bands.

Has anyone else got results ? Can we compare ?

Also, has anyone measured the waveform amplitudes around the DBM Mixer when in TX mode ? I seem to be lacking in drive to the PA IC. The TX output power is approximately 30 mW. I have measured the oscillator drive as 400mV P/P into the DBMs. The TX IQ AF input level is 1 Volt P/P during these measurements.

Others have reported 100 mW TX O/P. I would like to see where the difference is.

Regards
Ed GM3SBC

Ed:
I think you are off by a factor of 2 on the Oscillator drive. Likely because it is differential across the winding. Neither side of the LO winding is grounded. I get less than 20mW out of my UHFSDR. Didn't measure the audio input.

OK Dave , Thanks , yes that was only one input I reported.Regarding the TX output power, I wonder how others have reported much higher powers. Sid, states that he has 100 mW. It would be nice to know what output he is getting from the DBM under a stated drive level.

Mike I found that I had to rebalance the phase when going from 144 Mhz to 432 Mhz. There appeared to be a large difference but I could still get good results when I finished the adjustment.It must be said however that it was close to the maximum range available on WR Plus to achieve balance when on 432 Mhz. This would point to the need for any software being used to store the settings for each band or have rapid automatic phasing.

I measured the voltage and did the sums and it was pretty much the 100mW as stated in the build document.
I haven't got around to changing the HMC482 since it seemed to have died after connecting up to the 15W Amp. I'll replace it tomorrow and make further measurements.

Hi Ed

That would be an amazing about of sensitivity. Sounds card performance would make comparing performance station to station about impossible unless everyone runs the same soundcard. My best is -123 dbm for 5 db signal above noise floor. This is with a SDR Widget and signal generator is a IFR1200. Are you reading DBM level from the signal generator or in the SDR software? I would not trust the level in the software. I can not even generate a signal that low.

Hi Larry,

Yes I was surprised by the result. First , I am using an HP generator with level set at -100 dbm then a series of SMA 18 Ghz attenuators. In this way I hope to have removed any attenuator leakage problems. At the level quoted I am getting a clear visual trace on WR Plus. I would think that your result of 5 db S/N at -123dbm is very good. If you wish we could measure at a particular S/N and report back , say 1 db S/N in a 200Hz bandwidth.
Regards

Ed.

Just to point out that:
in order to have a uniform approach, when we refer to MDS, you have to specify if it is in accordance to the ARRL tests where the bandwidth for the calculation of the noise floor does play a significant role so as it is said in the test procedures manual "The test is conducted with the receiver in the CW mode using the 500 Hz".
"5.1 NOISE FLOOR TEST"
-> http://www.arrl.org/test-procedures-manual

I'm pointing this, since SDR applications, if and when they are level-calibrated, on their 'visual' representations of signals, have the 1 Hz bandwidth, so if you rely on the 'visual' level lines, it goes way off from the proper 500Hz computation of MDS measurement.

Just my 2c

73,
Christos SV1EIA

HI Ed

My measurements (as suggested by Christoes earlier) were made in CW at 100hz band width. I would be glad to make any comparison measurements that you want but without using the same soundcards my measurements would not be very useful as a comparison to yours. I have a few projects on the bench at the moment. Towards the end of the weekend I will measure sensitivity at different frequencies band widths and different signal levels above the noise floor The UHFSDR is the most sensitive RX I have in the shack!

Larry W9AMR

In a message dated 2/10/2012 5:32:16 A.M. Eastern Standard Time, ed.murphy31@... writes:

Hi Larry,

Yes I was surprised by the result. First , I am using an HP generator with level set at -100 dbm then a series of SMA 18 Ghz attenuators. In this way I hope to have removed any attenuator leakage problems. At the level quoted I am getting a clear visual trace on WR Plus. I would think that your result of 5 db S/N at -123dbm is very good. If you wish we could measure at a particular S/N and report back , say 1 db S/N in a 200Hz bandwidth.
Regards

Ed.

Measuring at 100Hz bandwidth will yeld a more than 6dB difference to the 500Hz, so if you have -123dB at 100Hz, it will be higher than -117dB in 500Hz.

Having said that, indeed the UHFSDR is the most sensitive one since it has a 18dB LNA on its frontend thus it works always pre-amplified. That is needed to counter the DBM and FST switch losses and it leaves more gain above them. By the way, after carefull calibration and observation, I'm having here with the UHFSDR/USB2SDR combo, a MDS of -130 dB at 500Hz CW.

Hi Christoes

I picked 100hz for my own reference. I know/notice that there was a difference in measuring sensitivity with the different band widths. I chose 100hz as a standard because I can select 100hz with my R390. Kachina and SDR radios. Of all the radios I have I put those as my top 3. And I have a lot of radios and have seen about everything else you can think of old and new. I use a sinad meter on the other radios to measure MDS and to be fair I should use one on the SDR as well instead of relying on the spectral display.

The UHFSDR was paired with a modified MOBO so I had the loses of the FST's and BPF in play. I love all the SDR stuff. It is amazing. And I really appreciate the work you have done with PSDR! I wish I could figure out what I did with the USB2SDR board I bought! I would really like to try it. I hope to run across it. Sooner then later! Did you release a PSDR version with CTCSS and repeater offset yet?

Hi Larry,

The repeater offset can be done with all versions by using the VFOA/VFOB Tx.
There is a new verion tested from a few USB2SDR/UHFSDR users having Wide/Narrow FM
deviation and CTCSS. These two are the actual new additions.
The results are good so it will next be released on the downloads list.

Nice to hear ...

I just picked up a used Compaq EVO 8000 with dual HT 3.0Ghz processors and 4gb ECC reg ram. Its far better than my pent4 800mhz laptop!!!

Hi Mike

I am battling a bit with Win7 64 bit. I can do XP just fine. I just bought a Dell i7 with 8 gig of ram. I will be glad when I get that going. If your using Win7 64 bit and get it going please let me know how it goes.

I have done FM repeater using split VFO and it works fine. The CTCSS version will be awesome! I can't wait! good job!.

Hi Larry,

The repeater offset can be done with all versions by using the VFOA/VFOB
Tx.
There is a new verion tested from a few USB2SDR/UHFSDR users having
Wide/Narrow FM deviation and CTCSS. These two are the actual new additions.
The results are good so it will next be released on the downloads list.

73,

654. MPLPF(100W Low Pass Filter)

Yahoo group: UHFSDR
Date: 2012-02-14 01:49:34 UTC
From: brainerdd
Topic: 654 Message: 654

I received 100 MPLPF boards today. It appears that if you are going to use the MPLPF with a SDR-Widget, you will have to reverse the order of the filters installed on the board. This is still in testing. The layout for all seven filters is identical, so it doesn't matter what order they are in. But, it must match the I2C software you are using.
I am procuring parts for parts kits. I will update the web page when I have the rest of the parts on hand.

Hi Dave

I worked with Chuck WA6LTV to help him sort his out. Another option would be to lift the gate connections or cut the foils and reroute the connections with jumpers. Not as pretty but it might be simpler then reversing the filter order. If they want to use it later with one of your projects it would be easier to reverse. It is up to the builder as to what he is more comfortable with.

FWIW I have 2 of these boards and they are very high quality. All of Dave's boards and designs are! I doubt you will be disappointed! I love his boards. End of commercial! (Unpaid of course).

657. MPLPF Filter Positions

Yahoo group: UHFSDR
Date: 2012-02-14 09:47:01 UTC
From: brainerdd
Topic: 657 Message: 657

I found the Mobo description of the LPF switching. I think this is the same as the SDR-Widget switching(correct me if not true). I uploaded a file showing the bit assignments for the Mobo vs the bit assignments for the MPLPF filters.
The bit number mismatch is not the only problem. My published design for the MPLPF uses one filter for 20 and 30 meters while the Mobo uses separate filters. The Mobo has no 6M filter, the MPLPF does.
One could, of course, re-design any of the MPLPF filters to cover any band. The board has spaces for more than one capacitor at each location. There are also pads for caps across the coils for elliptical filters. The layout for all seven filters is identical.
I also don't know if a low or a high turns on the Mobo filters.
I also don't know how PowerSDR-IQ does filter switching.
All but the 20/30 meter filters are based on built and tested filters by Wolfgang,DL4FDD. He had a separate 20 and 30 meter filter. I combined them to allow both a 160 meter and a 6 meter filter.

Hi Dave.

The MOBO and the Widget share the same filter switching order. But on a good note they are setup to switch up to 8 filters. The builder could just omit the 6m filter because the MOBO/NG doesn't cover 6m. and should be able to set the filter points accordingly.

Hi Alan

The BCD counting counts backwards between the 2 systems. The filter for the lowest frequency starts a 000 on Dave's board starts the highest frequency starts 000. When the Widget selects next filter it is 001. Dave's board looks for the controller to select 011.

The Widget firmware could be modified to handle the reverse order. I just don't know if the programmers want to add another menu selection. I think if they did it would make the widget more universal. But it's up to the programmers.

Larry:
Are the switch points on the mobo fixed or is their a frequency table. The the transition points are not fixed, I could provide a schematic with the filters in reverse order. Just involves changing parts designations on the schematic.

Hi Dave

There is a frequency table. The switch points are adjustable. I have tried in the past to set the next logically selected filter to a lower frequency instead of higher and it did not like it. So setting the crossover points in reverse doesn't seem to work. I will recheck and if it is still that way I will ask Alex or one of the coders what can be done.

That is good. With adjustable switch points then all we need to do
is to reverse the filter order on the MPLPF. Easy if not yet built,
harder if already built. I will revise the schematic(just involves
changing the values around). Not changes to the boards.

Topic: 657 Message: 665

Hi Dave,

This is the idea I had in mind, if not built easy, but could build the board in reverse order other wise.

Perhaps Alex or Loftur can change the order of the filter by 180 deg, in the Widget and make it a selectable choice for your filter...

I wanted to check with you first, to see if you had come across the issue yet, and had a simple fix before asking them?

I will hook your, now completed, amp and filter, up to a larger copper, aluminum sandwich cooler
and go for full power out this time. At 30 to 40 watts everything is going very well. Can't wait to put both in a
nice enclosure and put it to use...

Great Job on the new items....

Chuck Nolin

669. Si570 control from PowerSDR

Yahoo group: UHFSDR
Date: 2012-02-17 10:27:56 UTC
From: tony_g3ovh
Topic: 669 Message: 669

I have just finished building my kit and have a problem controlling the Si570 from the parallel port. If I change the tuning slowly I can get the Si570 to lock, but slightly too fast and it resets to its start frequency. Are there any tweaks to the LPT driver that can fix this - possibly slowing the I2C clock?
Tony

Topic: 669 Message: 670

Tony,

You need to see if the I2C wiring is ok.
Check the cables you use.
Make small cables and avoid long lengths.

Regardless of how fast you tune, the I2C works at a high speed,
if you tune by dragging the mouse then it sends more I2C 'tune' commands but always at the same bit rate, so its not the I2C frequency the problem you have, but I guess some sort of wiring/electrical as I mention above.
It could even be a cold solder on Si570 or the ADuM.

Just my 2c
Christos SV1EIA

Hi Mike

The QRP2000 should be able to control the Si570 but I don't know about the divide by 2 divider that the UHFSDR uses. Read the info. It is late for me to absorb the info this late LOL. I don't want to mislead you! lol. It has nothing to do with I&Q. That is the soundcard end of things.

The QRP2000 is a controller for the Si570 and it has a Si570 on the board The Si570 should be able to be left off and the I2C wired to an external Si570.

Subject: Re: [UHFSDR] QRP2000 & UHFSDR

I just notice I dropped the ball on the I/Q part. LOL I told ya it was
late!

I have used PSDR v1.12 the most. Some of the Versions tune in steps like
Rocky. I haven't played much with the other versions. How is your UHFSDR
project going? Hope all it well over there. I think I talked to your dad a
week or so ago about interfacing some stuff. How is he going?

Take care!

Subject: Re: [UHFSDR] QRP2000 & UHFSDR

Hi Mike

The QRP2000 should be able to control the Si570 but I don't know about the divide by 2 divider that the UHFSDR uses. Read the info. It is late for me to absorb the info this late LOL. I don't want to mislead you! lol. It has nothing to do with I&Q. That is the soundcard end of things.

The QRP2000 is a controller for the Si570 and it has a Si570 on the board The Si570 should be able to be left off and the I2C wired to an external Si570.

Hi Christos

Thanks for your suggestions. However, I have looked at the waveforms at the contacts on the Si570, and see no problem there - full 3.3V swing and good risetimes with the data changing , so there are no "dry joints" etc on the way there.
You might be right about the cable length - I have about 1.5m of unscreened wire from the UHFSDR to the parallel port on the back of the PC - I am not sure how critical are the I2C signals.
On my next test I seem to have got it working, but it seems that on each power up of the circuit it may respond or not, so I wonder if it is possible to get the Si570 into a reset condition which it doesn't want to come out of.

Hi Christos

Thanks for the clock speed document - looks like i should at least be using twisted pairs for the clock and data, although the document implies that you can use as much as a km of cable with the right drivers.
In my original post I was asking about driver tweaks. I notice there is a parallel port delay parameter in powersdr-iq. Can this in some way control I2C bus speed?

681. Sound cards and PowerSDR-IQ

Yahoo group: UHFSDR
Date: 2012-02-18 14:39:18 UTC
From: tony_g3ovh
Topic: 681 Message: 681

I am struggling presently to understand how the line in/line out/ microphone etc all relate. I have a PC with internal sound card and an external Creative SoundBlaster USB unit. I am using the SoundBlaster for IQ input because it is much quieter than the internal card, and I am using the internal sound card for speaker or phones o/p. So far so good. But when I want to transmit, if I plug the UHFSDR line in to the line out of the PC, it mutes the speaker o/p. Various combinations of microphone i/p will appear in the received audio. I cannot get PowerSDR-IQ to manage the interfaces when switching from RX to TX independently of settings on the AC47 mixer or the SoundBlaster mixer. I have so far not been able to find a setup guide.
I can see why people are using dedicated USB2SDR cards etc. Help gratefully received.

The chips that mainly used in homebrew for I2C, are for very short distances, most likely on the same pcb, or with wiring caution, on pcb to pcb.

The second doc shows you that if you want to move on with cables, then you should have appropriate 'drivers/buffers' for that task.

Its not just the levels as you mentioned in a previous post that need conditioning, it is overall the timing and synchronization of SCL/SDA pulses since their 'timed' difference is what makes the protocol work. With large cables and more specifically, with the introduced long wire capacitance, the signals loose their exact timing even though they have proper levels.

The port delay is not for that purpose, it was used for the SDR1K LPT I/F.

On most computer cables, the I/O lines are shielded separately. If the shield on both lines is not connected to ground, it is possibly being faulted by cross talk between the I/O lines. The higher the data rate the worse the cross talk gets.

From: philseaford
Topic: 688 Message: 688

Currently building up the UHFSDR kit and currently stumped at step 45 in the build sequence (Verify H1-3) where we check the ADUM device can pull down the data line when TP2 (SDA) is grounded.
Measured pulldown is 0.843 volts and the build procedure requires < 0.5 volts.
Have reflowed the ADUM connections and verified the the 4 1k pullups around the device are badged 1001 ie 1K
Any suggestions would be very welcome.
Thanks

Hi Tony

I am a little confused as to why you are switching cables to TX?

Using the on board soundcard for Mic and speaker is what I do as well. The external sound device (in my case a SDR widget) is used for I/Q. This is better for the reasons you describe. You use the VAC function in PSDR to handle the audio switching between the cards.

If you leave the USB soundcard plugged in windows like to select it as the default sound card when you reboot. Then it will repeat the mic audio out to the speaker when you use the internal card for mic and speaker. I unplug the external sound while (re)booting or go in to the sound device settings and change it back.

I have used 2 separate soundcards for 95% of my SDR for the nearly 4 years that I have been playing with SDR. I will agree a supported sound card works better, ie more features but 2 soundcards are totally doable and work very well. I can take screen captures of my settings if it will help you or anyone else. More then glad to help. Especially if it saves $$ that can be better spent elsewhere. A high dollar card is not a total necessity but great if you can afford it.

Topic: 690 Message: 692

By experience, 4 times is a maximum (most of the time, one reflow per side is a good and logical rule of thumb). After 5 reflows, your solder is badly stained, contacts can be affected. EXCEPTED if you can "spray" some flux on your board to keep your former solder points shiny and with good surface tensions during the next reflow process

693. Si570 CML via Xformers

Yahoo group: UHFSDR
Date: 2012-02-20 10:35:34 UTC
From: davidhooau
Topic: 693 Message: 693

Hi All,

I'd like to drive the UHFSDR from an external QRP2000 hosting a CML Si570 (DBA version). My best guess is to use the LVDS resistor and capacitor values on the UHFSDR IQGEN page, and then use the 1:1:1 transformer on the QRP2000 (with no ground jumpers).

Has anyone used this configuration? It looks to me that I get a 1:2 mismatch with T2 (on the CLK page).

Thanks,

davidh

Using the LVDS components should match the CML(it needs 100 ohm differential load and a series cap to isolte from the different DC offset of the LVPECL dividors. You don't need to install T2. Go directly from the Si570 outputs to TP6 and TP7. T2 is used for a single ended external oscillator.

697. Re: Sound cards and PowerSDR-IQ

Yahoo group: UHFSDR
Date: 2012-02-21 01:11:08 UTC
From: tony_g3ovh
Topic: 681 Message: 697

Hi Larry

I think I would be grateful if you can post screen captures of your settings. I have been looking at the powersdr-iq Yahoo group, and I am seeing the same questions coming up. My problem seems to be that when the linein is plugged in to the soundblaster card, it mutes the microphone even on transmit, so I cant feed audio from the speaker o/p on the SB to the UHFSDR. I can get VAC to route soundblaster output to the internal card output, so I can have the option of listening on the headphones plugged into the UHFSDR, or on my PC speakers. In order to transmit I have to unplug the linein from the SB. I can also plug the mic into the PC sound card and the lineout to the uhfsdr but the audio gets muted on transmit and no modulation takes place. This may sound all garbled and probably is - there are so many options and no simple explanation of how it is supposed to work. I keep coming back to it and playing for a while but have not yet cracked it.
Any help gratefully received,
Tony

Hi Tony

I will make the captures and write something up that you can hopefully follow. I am not much of a writer lol. I am sure we can get you going without to much trouble. If your in the USA I am more then glad to call you and talk you threw it or even use Skype. I will send you the info off list and if you think it is easy to understand I can post it somewhere that it can be useful.

Larry

Hi Larry

I think I would be grateful if you can post screen captures of your settings. I have been looking at the powersdr-iq Yahoo group, and I am seeing the same questions coming up. My problem seems to be that when the linein is plugged in to the soundblaster card, it mutes the microphone even on transmit, so I cant feed audio from the speaker o/p on the SB to the UHFSDR. I can get VAC to route soundblaster output to the internal card output, so I can have the option of listening on the headphones plugged into the UHFSDR, or on my PC speakers. In order to transmit I have to unplug the linein from the SB. I can also plug the mic into the PC sound card and the lineout to the uhfsdr but the audio gets muted on transmit and no modulation takes place. This may sound all garbled and probably is - there are so many options and no simple explanation of how it is supposed to work. I keep coming back to it and playing for a while but have not yet cracked it.
Any help gratefully received,
Tony

699. UHFSDR in Eddystone Die Cast Box

Yahoo group: UHFSDR
Date: 2012-02-21 14:18:46 UTC
From: Ed
Topic: 699 Message: 699

Hi All,
Thought you might like to see my UHFSDR now in its box. I managed to find an Eddystone Die Cast Box which is absolutely perfect in size. The external dimensions of the box measure 120 X 95 X 34 mm. The PCB fits nicely on the lid which in the photos is the Base of the box. I have included an USB interface which is made on a small PCB mounted above the main board. First of all I removed the Regulator IC and fitted it on the Base underneath the main PCB and added 0.1 caps between the In/Out pins and the centre earth pin. The large power resistor R1 was also removed from the main PCB and fitted on the interface board. The interface circuit is based on the Softrock, utilising the Tiny chip with firmware V15.12 and the opto IC to provide isolation for the PTT function. The output of this IC drives a PNP transistor whose emitter is connected to the +5 VF supply. The collector drives the TX LED and the Main board T/R PTT. I also included a diode connected in series with R1 to protect against the +12 Volt being connected in reverse. There are three additional connectors, The USB, PADDLES and the POWER, all fitted on the small PCB. The PADDLES connector has an insolated case which is long enough to protrude out through the back of the box such that the when the plug is fitted its metal work (earth) does not short circuit to the box. (This connector is within the isolated circuit section a should not be able to connect to the Main PCB earth.)
Dave, it would be just GREAT if you could manage to move the PSU components down the main PCB to make room for all three connectors. The POWER connector used by the Softrock kits is ideal for the job. The PADDLES connector was the type distributed by Alan, BTW the other three stereo connectors were the type you specified in the Farnell BOM. The Eddystone Box was obtained from MAPLINs, THEIR Part Number is: N90BQ See GM3SBC File Section photos . 73s Ed GM3SBC

Looks great Ed,
I used a Maplin AB15 aluminium box with the UHFSDR and SDR-Widget
mounted on the base with headroom for a QRP PA and BPF filters for both
RX and TX to be mounted on the top cover.
The box is painted with grey Hammerite paint.

The other Widget bits, LCD, rotary encoder, Power LED and switches on
the front.

On the backpanel Power input, fuse, antenna socket and holes for entry
of the audio cables and USB connector.

I also removed the 7805 and use outboard, a LM338 5A regulator on a 90mm x 90mm x 20mm heatsink with a small PC fan mounted in a Maplin plastic box with top removed.
The 13.8V to the UHFSDR is fed to the board via a 1N5822 diode. I removed R1 as the voltage drop with the 1N5822 in series with it was excessive.

Must take some pictures later.
73 ... Sid.

Hi Guys,

This reminds me of a story about my sister's husbands father. He was a very clever engineer but in his 80s. He bought a new stereo, but found there was nothing coming out of the left hand speaker so he took it back to the shop. They tested it and found it to be OK. He took it home and found the same fault. Thinking he had been ripped off and there was nothing he could do he want to another shop, bought another stereo and had the same problem. This time he took the stereo apart....no fault found.....so he went to another shop, bought a third stereo and had exactly the same problem....thinking he was loosing his sanity he went to see his doctor. The doc did some tests and told him he was not mad....just deaf in his left ear.

From: MIKE DURKIN
Topic: 706 Message: 706

Has anyone tried more than 2 values of L1(3.3uH & 560nH) in series?

Does it matter which one is tied to the output of U5?

Id like operation to 700mhz but 480mhz will do....

Would the 560nH suffice up to 700mhz or?

Also has any one measured the loss of T1? Is it actually 5db at 500mhz(gleaned from datasheet) or less ....

That was a lot of yahoo groups !

Concerning your question, you just have to read the very first document describing the ☐AR☐ family

http://yu1lm.qrpradio.com/HF-VHF%20SDR%20receiver-part1-YU1LM.pdf

page 7 :

AR1 is the simplest,

AR1B is the best performer, with low noise op amps

AR1C is the same as AR1B, but with a stronger noise factor

All of them are running perfectly well, particularly if you use ☐high level☐ mixer like the SRA1H

These receivers must be followed by a rather ☐strong☐ (13 to 20 dBm) local oscillator on port 8 of the mixer.

The bandpass filter will be a trivial question once you have build your receiver AND your local oscillator. This kind of filter could be made with some length of hand formable coax cable, printed stiplines on a pcb, or more classical ☐hairpin☐ LC circuits

73☐

Mike:
Using 2 chokes in series, doesn't matter which comes first. The
560nH value is right from the mmic data sheet, so should go much higher
in frequency depending on the SRF of the coil.

714. UHFSDR Sensitivity Improvement

Yahoo group: UHFSDR
Date: 2012-02-22 21:15:18 UTC
From: Ed
Topic: 714 Message: 714

Hello All you UHFSDR lovers,

I decided to do some further measurements of the MDS on my UHFSDR.

I started by measuring the UHFSDR unmodified in the following set up conditions:

Software: WRplus
PC: ASPIRE One Net book
Signal Generator: HP with additional Microwave attenuators.
Mode : CW
Frequency: 144.300 Mhz
Bandwidth: 500Hz
AGC:Off

The result for 1 dB signal above noise power : -133dBm.

I then decided to change U4 (BGA612) to a different type of MMIC, the SPF5043Z. This is a 50 Mhz to 4 Ghz part with high dynamic range. It has a lower noise figure and higher gain than the BGA612.
The mod was simple, remove the BGA612, install the SPF5043Z taking care to check the different orientation and replace R3 (120 ohm)with a 100nH Inductor.

The result for 1 dB signal above noise power : -145dBm

So if you want a super sensitive VHF/UHF front end, you got it !

Only possible down side is that the IC starts to degrade below 50 Mhz. It could still be adequate for the DC bands if you really must use the UHFSDR for that purpose.

What a remarkable little radio this is.

Regards

Ed GM3SBC

Hi Dave,

The Return Loss and Gain starts to degrade below 50 Mhz and the specification does not detail any lower frequency performance. However they could well be adequate for the lower frequency requirements.
I can do tests down to 10 Mhz on this sample of one as an indicator and report back.
Spec sheet :-

Ed:
If you test the mmic at HF, you will need to increase the value of
the choke. 1uH will probably be OK to 10 MHz, 3.3 uH for lower.

Sounds like another instance of series set chokes, 100nH & 560nH and a 3.3uH ....

Probably will look odd .....

Mike KC7NOA

If you test the mmic at HF, you will need to increase the value of
the choke. 1uH will probably be OK to 10 MHz, 3.3 uH for lower.

Dave - WB6DHW

<http://wb6dhw.com>

On 2/22/2012 1:15 PM, Ed wrote:

Hello All you UHFSDR lovers,

I decided to do some further measurements of the MDS on my
UHFSDR.

I started by measuring the UHFSDR unmodified in the
following set up conditions:

Software: WRplus

PC: ASPIRE One Net book

Signal Generator: HP with additional Microwave
attenuators.

Mode : CW

Frequency: 144.300 Mhz

Bandwidth: 500Hz

AGC:Off

The result for 1 dB signal above noise power : -133dBm.

I then decided to change U4 (BGA612) to a different type
of MMIC, the SPF5043Z. This is a 50 Mhz to 4 Ghz part with
high dynamic range. It has a lower noise figure and higher

gain than the BGA612.

The mod was simple, remove the BGA612, install the SPF5043Z taking care to check the different orientation and replace R3 (120 ohm)with a 100nH Inductor.

The result for 1 dB signal above noise power : -145dBm

So if you want a super sensitive VHF/UHF front end, you got it !

Only possible down side is that the IC starts to degrade below 50 Mhz. It could still be adequate for the DC bands if you really must use the UHFSDR for that purpose.

What a remarkable little radio this is.

Regards

Ed GM3SBC

Mike:
I have 3.3uf but not 560nH. The 3.3uf data sheet shows a SRF of 260 MHz so would be good at least through 220 MHz. Probably good at 420 MHz, although above the SRF.
Mouser lists the 3.3 uf at $0.47. Could ship for a first class stamp in a regular envelope or $1.64 in a padded envelope.

Hey guys,

Can we show a bit of understanding here? There are a lot of people on the list who don't have the command of the English language that us native speakers do. So it is pretty easy to misinterpret their meaning and take offence when none was meant. Even American English is different from English English. Churchill once said that the USA and Britain were 2 great nations divided by a common language.

FWIW the Softrock group has a lot of people on it who are very knowledgable about SDR software. In fact a couple of people in it actually wrote the stuff. So it might be worth subscribing there if you
want to learn about the various packages available and their plus and minus points...

Hi All

I have used PSRDv1.12 with WinXP. The only real issue I have is I am limited to a highest frequency of 365mhz. The limit would seem to be Widget controller. Other then that I have ran it since it was released and it works great. I have played a bit with Winrad but it is RX only.

I have no Linux experience but hopefully that will change!

Mike,

:-))

There's no slap whatsoever.

I just tried to tell you that's still a lot to see around. Thought to be able to see things working, you must first Make Them Working ;-)
and it seems that this is the most difficult part based on what I've seen from the SDR homebrew users all these years.
To say that this or that is the best because you could not make the others work at all, it does not reflect the reality.

Now, regarding help, I suggest you take it step by step and not rush into it. If you rush, then you cannot appreciate any given help, and from what I've seen, you do have taken quite help so far in various groups, yet you rush much and you do not absorb it.
I only hope that any help you have taken so far and will take in the future, will come back to the community and you will help others too.

Just my 2c.

73,
Christos SV1EIA

Hi Dave

I cant see a price on Digikey - are you sure you got the right part? The Farnell 1 off price in the UK is £22.15 plus tax and p&p with the 100+ price at £16.61 - obviously a premium part but does anyone want to spend that much more?

Hi Dave,

(wrote a big reply and lost it so now out of time, short one !)

Re DC Band operation:

Using a VNA I check the gain response using the 100nH Inductor only and below 4 Mhz the gain was several tens of dBs down.

I did not have any other suitable Inductors to hand so decided to insert a 47 ohm resistor in series with the 100nH Inductor.

The SPF5043Z bias is now 3.6 volts from the 4.7 volts with the choke alone.

Measuring from the J4 socket to C8 output.

1.5 Mhz to 150 Mhz Flat with a ripple of 0.43dB
150 Mhz to 432 Mhz rolling smoothly down by 10dB
432 Mhz to 700 Mhz Flat, ripple 1dB

Results:
10 Mhz -145dBm
30 Mhz -145dBm
144Mhz -145dBm
220Mhz -143dBm
432Mhz -140dBm

Could be useful now to have a couple of beta testers to check this confguration and possibly other Inductor arrangements should you be concerned about the gain flatness and IC bias requirement.
Remember to check the IC pin out, the in and out are reversed

The Farnell price is scandalous, I don't know how they can justify it.

736. Fwd: DIGIKEY CUSTOMER SERVICE SAL# 32281542 REFUSAL LETTER

Yahoo group: UHFSDR
Date: 2012-02-23 22:12:56 UTC
From: Stacy Williams
Topic: 736 Message: 736

Dear all

Please forgive me, this is not spam but my experiance today was a bit porky:-)

I feel it is important that other fellow hams are advised about certain policies of Digikey regarding payment of VAT in the UK and, perhaps duties in other countries. Also, it is impotant that our ham cousins in the US observe how we are treated by this Company.

PLEASE look at the link on the digikey.co.uk web-site pertaining to payments of VAT and free delivery on order over £50. Also I would e grateful, if you might make some screen shots so Digikey do not decide to invoke plausable deny-ability.

It is a real privelage, to be involved in some of the projects and groups that Im involved in through the internet. Also, i would like to say thank you to all our Cousins around the world and, in particular the US allowing us to purchase directly and fairly from you in the past and, into the future

With kindest regards & 73
M0WSA

Dear STACY WILLIAMS****

****

I received a call from UPS regarding the shipment of the order you placed by internet on 18-FEB-2012. We shipped the package to you via UPS per your request on 20-FEB-2012. UPS has contacted us to advise us that you are refusing the package and have requested that it be returned to Digi-Key. I am contacting you to advise you of the options we have: ****

****

1.) You may accept the package and remit payment for the duties & taxes that is being collected by the courier. ****

****

** **

2.) If the package is not accepted, Digi-Key will need to decide whether to have it returned or abandoned. ****

a.) If the package is returned to us, we will only issue credit to your credit card for the cost of the parts less the return shipping charges to Digi-Key. You will also be responsible for the initial shipping charges. Also, if UPS requires payment of the duties/taxes for the package being returned to the United States, Digi-Key will be billed for these charges from UPS and in turn, we will bill you for these charges ****

b.) If the package is abandoned, you will be charged for the cost of the parts and the initial shipping charges which was invoiced on the original invoice as 51.58 No credit will be issued to you. If UPS requires payment of the duties & taxes that have been accessed by customs, Digi-Key will be billed for these charges from UPS, and in turn, we will bill you for these charges. ****

****

****

** **

Please respond by 24-FEB-2012 with your decision as to whether you will accept the package. If we do not hear from you, Digi-Key will need to make the decision to have the package returned or abandoned. Since we processed & shipped your order as you requested, you will be billed for any additional fees accordingly. ****

****

I am looking forward to hearing from you. ****

****

Sincerely, ****

I have ordered from Digikey in the past and sometimes the shipping on small parts orders have been exhorbitant. Luckily at present I can send a list to a relative in the US and have it shipped to me very cheaply. That's the route I've chosen earlier today for some small parts.

Only yesterday I placed a direct order for a Pandaboard, $170.00 in the US and ?120.00 to UK plus the 20% VAT when it arrives so I decided to go for it.

I have also ordered 1N5822's, AS169's and HMC482's from Hong Kong/China with reasonable shipping rates from Hong Kong. The estimated delivery time was a month and a half but they arrived in about 10 days.

The shipping costs from China via DHL, UPS etc. is also just ridiculous at several times the cost of the items, e.g $20.00 US for the parts and $69 US for shipping.
73 ... Sid.

Hi guys,

Actually Digikey are not alone in this. Ordering from Farnell in the UK can be tricky if you are not mindful. Much of their stock is held in the USA for which IIRR there is £15 (roughly $20 US) delivery charge. Then I guess on top of that there will be a 20% VAT and £7 customs inspection charge to pay. When you are ordering stuff you need to click on the "exclude extended stock range" button to avoid this. Actually I ordered all the parts from Farnell to build my UHF SDR partial kit which I must get around to doing.

On a more positive note I ordered some stuff from Farnell the other evening, The transistors came from their Belgium warehouse and were delivered within 18 hours by courier. The rest of the items arrived by post within a day. Because I ordered £30+ worth of stuff I did not pay for shipping.

Sometimes I buy surplus stuff from China (mostly crystals). The retailers always undervalue the goods on the customs invoice no matter what I have paid....

Stephen:
Newark in the USA plays the same game in reverse. Some of their
stock is in the UK and you must pay a $20 per order charge.

Dave,

That's interesting. May be Newark is Farnell in the USA and Farnell is Newark here.....?

Anyway, if anyone on the list wants stuff from over here i am happy to order and ship it at cost by prior arrangement. I take Paypal. I generally buy from Rapid Electronics and Farnell for the small kitting business I run with Hans G0UPL. So it is no problem to add stuff to the orders and ship it in a bubblewrap envelope airmail.

I forgot to mention Farnell UK in a much wider context. Even if their parts are stocked in the UK, orders under ?20.00 carry a high shipping charge and if they come from elsewhere in the Farnell empire you get a surprise so it's necessary to be very watchful when ordering.

I normally prefer to order from RS Components if they have parts stocked or from rapidonline.

Subject: Re: [UHFSDR] L1 choke values

Mike:

I have 3.3uf but not 560nH. The 3.3uf data sheet shows a SRF of
260 MHz so would be good at least through 220 MHz. Probably good at
420 MHz, although above the SRF.

Mouser lists the 3.3 uf at $0.47. Could ship for a first class
stamp in a regular envelope or $1.64 in a padded envelope.

Subject: Re: [UHFSDR] L1 choke values

Mike:

Using 2 chokes in series, doesn't matter which
comes first. The 560nH value is right from the
mmic data sheet, so should go much higher in
frequency depending on the SRF of the coil.

Dave - WB6DHW

<http://wb6dhw.com>

From: davidhooau
Topic: 693 Message: 750

Thanks All,

I'll move the Si570 to the UHFSDR. I'd only be happy connecting via 50 ohm coax, and the current transformer on the QRP2000 tops out at about 250MHz anyway, plus I'd need a 2:1 for T2.

Cheers,

david

That's where/why I put my Si570BBA LVDS on the UHFSDR .... though im not sure the AVR firmware checks for the "A" grade freq gaps .....

Subject: Re: [UHFSDR] L1 choke values

Mike:

I have 3.3uf but not 560nH. The 3.3uf
data sheet shows a SRF of 260 MHz so would
be good at least through 220 MHz.
Probably good at 420 MHz, although above
the SRF.

Mouser lists the 3.3 uf at $0.47.
Could ship for a first class stamp in a
regular envelope or $1.64 in a padded
envelope.

values

Mike:

Using 2 chokes in series,
doesn't matter which comes
first. The 560nH value is
right from the mmic data
sheet, so should go much
higher in frequency depending
on the SRF of the coil.

Dave - WB6DHW

<http://wb6dhw.com>

On 2/22/2012 8:41 AM, MIKE DURKIN wrote:

Has anyone tried more than 2 values of L1(3.3uH & 560nH) in series?

Does it matter which one is tied to the output of U5?

Id like operation to 700mhz but 480mhz will do....

Would the 560nH suffice up to 700mhz or?

Also has any one measured the loss of T1? Is it actually 5db at 500mhz(gleaned from datasheet) or less ....

Farnell, Newark ect are to be come Element14 World wide over the next year or so.

One thing to bear in mind is that for small orders Farnell do not Charge for postage when your order is over ?20-00 nett VAT.

Where as RS Components want postage on orders up to about ?100-00

Hi Clive

Than you for your kind email.

This has all become a bit of a mine field. However, i agree Farnell will be used for all smallish orders. When in truth, its not really worth putting an order in unless it over £20. For under this ammount, I feel ebay might be as good as any where.

Regards

Stacy

hiya Jeff

Sorry for the silly, question, but would the preheater be used for just removing smd components or, perhaps when you install them too?

Also, would i still need to use the hotair nozzel in conjunction with the heater to install and remove components?

Looks like it can be used for removal .... though id rather use a embossing heat gun with a reduction nozzle ....

I do my pub's in a toaster oven .... set the dial with a digital thermometer to 425°F. It takes just under 10 minutes to hit that temp .... slower than advised heat curve ... but im not doing production!!!! Im a ham.... I paid 10$ for the toaster oven ....

Hi All

I built a new cable - 1 metre long with 2 coax cables for the I2C signals. This works perfectly from the PC parallel port with PowerSDR-IQ - no more resetting of the Si570. Thanks for you various advices.
I have just bought a QRP2000 USB synthesizer kit without Si570 from SDR-Kits so I can control the Si570 from a laptop, so a new period of learning will follow soon.

C55-C56, L3 and C53-54 and L2 are the 2 filters. I haven't worked
out values for 192 KHz(actually +-96KHz). But, I would think reducing
the 180uH to 120 uH and reducing the 2 series caps to .068uF each should
be close.

767. Re: Sound cards and PowerSDR-IQ

Yahoo group: UHFSDR
Date: 2012-03-04 14:56:04 UTC
From: tony_g3ovh
Topic: 681 Message: 767

Hi Group

I am finally operational From Larry's info and the document available from SourceForge (and elsewhere) PowerSDR-sr40_Setup.pdf (search on Google) which is a 14 page document explaining how to set up for 2 sound card operation and in particular what the PowerSDR setups do.
My main "gotchas" were to use my external USB SoundBlaster card for both in and out to UHFSDR. However to get microphone audio through the system you have to set up VAC and in particular make sure Mic is ticked as an input source in the "Recording" controls of the PC - without this you can get the internal test tone but not the microphone audio. I thought I had my system working with a different setup and was live on the air when the other G station I was working pointed out I had double sideband transmission, not SSB! That was because I was using PC audio line out to feed the UHFSR, not the audio from the external card which carries the IQ processed audio.
Final tweaks need to made to latency - I am having trouble with delay on Tx audio and echo between PC speakers and the headphone o/p from the UHFSDR - can get rid of it, but it seems to come back after going to Tx and back to Rx. Also, I cannot see how to get the VOX to work since (I believe) the PC mic input is switched off on receive.

Thanks for your help and I hope these additional notes help anyone else who might be struggling

Best regards
Tony G3OVH

768. Up and running!

Yahoo group: UHFSDR
Date: 2012-03-04 15:44:50 UTC
From: tony_g3ovh
Topic: 768 Message: 768

Hi

I'd like to publicly thank the various correspondents who have helped me get my UHFDSR working with PowerSDR-IQ. I have posted some details of that elsewhere.
Also many thanks to Alan Hill who provided the full kit - I had a few problems with labels falling off a few components, but was able to identify them with a little help from an internet document on package idents for surface mount components - perhaps you could use labels which are more sticky? The packet with the FST3257 was labelled FST3253. ADE2A5K packet was labelled CD542. There were one too few 10K resistors in the kit and I lost one or two components in my carpet tufts and had to substitute a couple of resistors off an old PC card. I lost the tiny diode D1 and was going to have to substitute a wire ended one when I discovered it just by the edge of the table leg. All components were hand soldered - hence the occasional tiddly wink flipping problem off the bench and onto the floor! I would recommend fitting the RG174 jumper from P3 to P4 underneath the board as suggested elsewhere (too late for me) as on top of the board it makes it very difficult to mount some components later. I mounted U9 upside down at first and only found out during testing of that section. Fortunately no damage done as I was able to remove it and reinstall the correct way round.
I did not have frequency control of the Si570 at first so I had to look up the default frequency of my device on the website of Si Labs (19.982MHz).
I had a few problems in testing the t/r rf switching until I found I had forgotten to link H5-2 to H5-3 to enable AS169 levels, and also the logic levels are in error in the assembly document - I found this mentioned elsewhere in this group. The t/r switching seemed a little wrong and I though I might have damaged one of the AS169s - I was getting partial transmission through U7 when it should have been blocking - this may have been because of some mains pickup on these very high impedance circuits - anyway it seems to work OK.
I had to fit a temporary heat sink on the 5V reg U1 as it runs too warm otherwise with the particular power supply I was using which was only slightly over 12V.
I have had my first contacts on HF for many years over the last few days - I am a happy bunny!

Thanks again all
Tony - G3OVH

Hi Tony.

I am glad to see your making progress. There is a monitor function you can turn down. That will stop the eco in TX. The mic audio coming out of the speakers. Sound while RXing is normal. You can use a relay to break the mic audio on RX.The Speaker/Mic needs to be on the default sound card.

773. BCD to MPLPF

Yahoo group: UHFSDR
Date: 2012-03-06 04:00:23 UTC
From: brainerdd
Topic: 773 Message: 773

I just ordered prototype boards for the BCD to MPLPF boards. This board will replace the PCF8574 and the ADuM1251 to allow selection of the filters by BCD command rather than I2C. The testpoints on the BCDto MPLPF board line up with the testpoints next to the PCF8574 and C9.
It will be about 2 weeks before they arrive. For those that already ordered the kit I will send PCB for the shipping cost. For kit orders, I will offer the board and the CD4028 in place of the I2C components(same price).

I neet to download the DLL and see if that solves the problem. The 2x and 4x terms refer to operating frequency of the radio relative to the frequency that the Si570 is operating at. UHFSDR operates at 1/2 the Si570 frequency. Some implementations operate at 1/4 the Si570 frequency.

Jim:
2X refers to the LO multiplication factor. For the UHFSDR, the
Si570 is 2X the center frequency. On almost all other SDR's it is 4X.

Sorry for asking this is already been answered ....

During transit what is the audio input into the ufdsdr normal level peak
peak / average? From the sound card ... scope isn't working again and ill
haft to use a com.

2 different USB soundcards based on the C-Media audio 7.1 Channel IC. Both are USB 2.0 but since Windows only does 16bit im limited to 48khz sampling .... more than enough. Turns out my problem was that I didn't notice HDSDR has a mix gain and Rx power DURING Tx .... I had an accident and the mix gain was set to 5%..... and I didn't see it for over an hour .... lol

Hi Mike

That's why I asked about the sound card. The widget doesn't have a mixer. I am glad you got it! I have puzzled over issues like this too, just to find out it was a simple setting. This stuff is fun! And a learning experience.

796. Build problems U10 Receive audio op-amps

Yahoo group: UHFSDR
Date: 2012-03-10 13:28:28 UTC
From: rubines2000
Topic: 796 Message: 796

Hi

I am in te process of building my UhfSdr page 5.

The test for the Receive audio op-amps stage is the following:

112. Connect Line-Out cable to PC sound card
113. Apply 10 to 15V to P1-1, Ground to P1-2
114. Run IQGEN.exe on PC. Set one tone to 1000 Hz at max level.
115. Monitor U10-1 and U10-7 with oscilloscope. If no oscilloscope is available, connect a cable from J2 to Line-In on PC audio card and run a PC audio oscilloscope program. One channel will show a 1000 Hz sine wave approx ____ Vp-p. The other channel will show a 1000 Hz sine wave approx _____ Vp-p.

Unfortionately I don't see a sine wave on U10-1 and -7.
On the scope there is more or less a flat line.

I am also not sure how the signal should get from the tx stage and U9 where the signal is fed to, to the receive stage and U10.

Did I do something wrong?
Where should I look for the error?

Cheers
Michael OE1MIS

Michael:
Check at U9-2 and U9-6. That is the input from the soundcard
output. You should see a large(1 or 2 volt peak to peak) signal.

Hi Dave

Thank you for your help.
U9 works, amplicication is 1:1. What makes me wonder, is that the same test is suggested for U10 and I hve no idea how the signal should get from the line out over U9 to U10.

Cheers

Hi Dave

Oh god,...
I removed them after the transistor test.
Since I meanwhile soldered U9, could I route U8-9 to U8-2 and U8-12 to U8-5 to test the receive op amp stage ?

Thank you for you help.

Cheers
Michael

Michael:
No, that would put too much signal into the pre-amp(would not hurt
it, but the output would be very distorted. Going through the 10K
resister attenuates the signal since the input impedance of the audio
pre-amp is close to 50 ohms.

Hi Dave

Thank you for your help, I could meanwhile verify the function of U10, by simply injecting the signal to pin 2 and 5 of U8 over a 10k resistor.

Please excuse this probably dumb question, but what for do I need the spkr output ?

Cheers
Michael OE1MIS

803. FW: Board arrived

Yahoo group: UHFSDR
Date: 2012-03-13 01:50:31 UTC
From: The Silver Fox
Topic: 803 Message: 803

Anyone know?

73's

Alan - W6ARH

From: Nigel Andrews [mailto:n.andrews@...]
Sent: Monday, March 12, 2012 6:40 PM
To: 'Alan Hill'
Subject: Board arrived

Hi Alan,

Kit arrived safely, thanks. Question: What is the difference between
UHFSDR_R1 and R1a? The current documentation shows _R1 ?

Thanks

Nigel

I had to go back through the previous Gerbers(I should have been keeping a running list of changes). The footprint for L1 was made larger on R1a. Everything else is the same.

Dave's the man.
Both of mine are _r1a and I didn't have any problems building them using
the available documentation.
I never noticed the docmentation said _r1.
Probably minor differences in PCB routing.
73 ... Sid.

806. UHFSDR ENCLOSURE!

Yahoo group: UHFSDR
Date: 2012-03-15 17:33:06 UTC
From: Gareth
Topic: 806 Message: 806

Hi there to all in the group.
Does any one know where I could get a good make of enclosure for the board as my local people are not helpful.
It would be nice to get an already made up one in metal for shielding and so on.
I am having a hard time in building the kit but nevermind!!
Well bye for now
73's
Gareth 2E0GGO.

Hi Gareth,

Enclosures come in many shapes and forms. Providing the UHFSDR board fits in it and anything else (Band Pass Filters, Low Pass Filters, PSU) and there is space on the front and/or rear panels for connectors pretty much anything should do. You could try and make one yourself out of PCB stock. Whatever case you end up with you will have to drill for the connectors anyway, and paint, labels etc which could mar one of those nice expensive cases made by people like Hammond...

Hi ,

A good enclosure for that ONE board, as you asked, is demonstrated in the Files section re GM3SBC. Please see my message on the Eddystone Diecast Box for the UHFSDR.

Regards
Ed GM3SBC

810. The Oscillating PA

Yahoo group: UHFSDR
Date: 2012-03-15 23:34:59 UTC
From: Ed
Topic: 810 Message: 810

Hi All,

Since enclosing my UHFSDR in a box, as shown in the files section under GM3SBC, I started to observe the fact that I was getting RF power out while in the TX mode WITHOUT any TX drive. It turned out to be the TX mmic oscillating. The fix was to place a 470 ohm resistor in parallel with the inductor which is connected at the TX mmic output. This modification did not appear to cause any reduction in output power at several frequencies tested.

Regards
Ed GM3SBC

Hi Mike,
I had the original 3.3uH only to start with. It was oscillating in this configuration. The 470 ohm in parallel fixed the problem. I then removed the 470 ohm and placed a 100nH in series with the 3.3uH, it was oscillating. I then placed the 470 ohm in parallel with the two inductors, the PA was stable. The maximum frequency I checked the power output was 144 Mhz. The conclusion was the 470 ohm does not reduce the output level at that frequency.

Top grade Si570

Topic: 810 Message: 816

I have no idea what they sell for, but I'd like them for insurance as
the 2 free samples I got from SiLabs failed as did one I got from G1CET.
My guess is the free samples were ones that didn't pass testing.

I have no SMD inductors spare. It was GM3SBC in this post.

Hi Mike,
I had the original 3.3uH only to start with. It was oscillating in this
configuration. The 470 ohm in parallel fixed the problem. I then removed
the 470 ohm and placed a 100nH in series with the 3.3uH, it was
oscillating. I then placed the 470 ohm in parallel with the two
inductors, the PA was stable. The maximum frequency I checked the power
output was 144 Mhz. The conclusion was the 470 ohm does not reduce the
output level at that frequency.

Top grade Si570

LVDS will work. Some components need to be changed(see schematic).
The biggest driver for price is the speed grade.

Sorry that I have to recoup my costs. On the up side they quoted me $93 for single quanities. I could go lower if I could buy twice what I can barely afford since they discount on bulk buy.

Then again, the best chips are over $100 even when bought in bulk.

From: The Silver Fox
Topic: 822 Message: 822

Any advice for Geoff? As far as I know, the black bar is only on resistors. SMT caps that I have seen have no black bars. I believe that USB speed is not important but faster is better.

Hello Alan,

Thank you kit received OK.

A couple of questions

1. I have got to UHFSDR Assembly Instruction No. 110. The 1uf caps do not have a black bar on them, so are you no longer using "tants" or have I got the wrong item?

2. I would like to use a USB interface. Is the HSUSB suitable for use with the UHFSDR ? If so does the PC require a "High Speed" USB2 instead of a standard USB2?

From: MIKE DURKIN
Topic: 822 Message: 823

As far as USB ... I use QRP2000 to control Si570 and Tx/Rx ..

The caps - check the BOM ... then check where it came from... then use the part number to find a pdf description of that part.

Subject: [UHFSDR] FW: Mr Geoffrey Suggate sent you $194.00 USD

Any advice for Geoff? As far as I know, the black bar is only on resistors. SMT caps that I have seen have no black bars. I believe that USB speed is not important but faster is better.

Hello Alan,

Thank you kit received OK.

A couple of questions

1. I have got to UHFSDR Assembly Instruction No. 110. The 1uf caps do not have a black bar on them, so are you no longer using "tants" or have I got the wrong item?

2. I would like to use a USB interface. Is the HSUSB suitable for use with the UHFSDR ? If so does the PC require a "High Speed" USB2 instead of a standard USB2?

Hello Alan Hill,

Just thought you'd like to know Mr Geoffrey Suggate sent you $194.00 USD.

Note from Mr Geoffrey Suggate:

Funds for UHFSDR full kit. Please ship to Geoff Suggate, 26 Highlands Rd,
Buckingham, Bucks MK18 1PL , UK when kits are available in Feb Many thanks

Geoff:
Actually, I believe the bar should be white(if the background is black). Only electrolytic caps have a bar. The ceramic caps used are non-polarized, so don't need a bar. The reason for the tantalums in those 2 locations is ceramic caps are microphonic and the audio amp has a lot of gain. When we had ceramics there, you could tap on the board and it sounded like you were playing a drum!
The HSUSB does work with the UHFSDR and Christos has support in PowerSDR-IQ. The HSUSB will work with either USB 1.2 or USB 2.0. The I2C spec is 400 KHz max and this is well within the USB 1.1 capability.

825. Dave's BPF Build - Have some questions

Yahoo group: UHFSDR
Date: 2012-03-19 00:24:33 UTC
From: Hank
Topic: 825 Message: 825

Dave,

Finally got around to finishing my BPF board.

I have 4 questions regarding the board I have. (originally I had 2 but then when I started to write this message I came up with questions 3 and 4, sorry!).

1. The version I have (BPF_R1) looks like it has an extra cap location on the back C60 (hard to read slik screen) below R2. Should this be installed and if so, what value for the cap?

2. Now that I have the board fully populated except for the headers. Is there any documentation on connecting this into the UHFSDR.
From schematic,

H1 Binary selection of band pins 1-3 ground pin 4.
H2 power (+5V) should be supplied on Pin 1 of H2, ground to Pin 2 H2.

I am not sure what H3-H8 do. Probably RF IN/OUT on H5/H6 but then I am not sure of purpose of H3/H4 and H7/H8. Can you elaborate on these pin assignments.

3. How do I switch the bpf board in for receive and out for transmit. Do I do this with an external relay or does the board handle this itself.

4. I have a SMC connector on my UHFSDR soldered to the board. I was thinking of putting a pigtail on the BPF board with a SMC male which I could connect to the UHFSDR board. Then a second pigtail for chaining to MPLPF or out to antenna. Do you think that would work using some RG174?

Sorry again for all the questions. For a SMD populated board it was really easy to build. Thanks for the nice layout!

Hank

Hank:
C60 is a .1uF capacitor.
The switching logic can select one of 8 filters. There are only 6 filters on the board. Two additional filters can be connected between H8 and H3 and H7 and H4. H5 and H6 are RF in and RF out.
You would have to use an external relay to switch the BPF in and out. One other way is the set up the UHFSDR for separate transmit and receive inputs. The put the BPF in the receive path and us a relay to switch the antenna.
I have not published instructions for connecting to the UHFSDR(it was originally designed for another project).
Assuming your cable length is not more than a few feet, RG-174 will be OK.

Dave,

Thanks much. Just curious if it would be OK to use an AS169 on an external daughter board to do the switching between the BPF for receive and the MPLPF for transmit similar to U2/U7 in the T/R RF Switching. I know I would use only 1 and tie it into something like the 74AC00 on pins 3/6 via an optocoupler as not to put a load on the UHFSDR signal lines. Maybe a better place would be the T/R singnal on pin 1 of P2. Would that type of arrangement work?

Dave,

Thank you for the help and guidance. Will tell you how it goes over the next couple of weeks. Happy to hear of the availablity of using 2 additional external filters. Would like to try to bring on 2m and 70cm bands.

Now Iv got a question .. do you really need T1 or can a choke from pin 4 to 6 and a DC blocking cap for hte input to pin6? I take it if your going to try to use 144Mhz and 470Mhs it probably be better to get a ADT1-1 ..... but for HF ....??I do have a TC1-1-13m+ .. but its not rated below 4.5Mhz ... any one sweep it lower ?? Mike:
I can't figure out what pin 4 and pin 6 your talking about. T1 is used as a power splitter/combiner for the input/output of the two mixers. Do you mean T2? It is only needed if you are using an external osc in place of the Si570 or need another output from the Si570.

Mike:
Duh, the subject was BPF build. I would think the choke and blocking
cap would work. The FST3251 switches do need to be biased at +2.5V
through the choke.

834. UHFSDR build started

Yahoo group: UHFSDR
Date: 2012-03-20 22:20:00 UTC
From: David Turnbull
Topic: 834 Message: 834

Hello,

I've just started my UHFSDR build. I want to lay out my basic plan for critique in case I don't understand something. I have Alan's parts kit, a QRP2000 (sans Si570), and a MPLPF. I may tinker with VHF/UHF but this will be an HF rig.

The QRP2000 is temporary until I get a SoC linux board with I2S. It looks like I just need an opto-isolator for PTT and this should completely control the UHFSDR. I'm not sure the pe0fko firmware on the QRP2000 can control the MPLFP though. Has anyone played with the [DO NOT USE] commands and hacked this working? I'm fine with using MPLFP jumpers until I get a SoC board.

This passive I/Q mixer came as a bit of a surprise. I also like that the Si570 has isolation on the I2C side instead of destroying the output square wave in a transformer. I don't know much about the theory of operation except what I can absorb from the schematics. Am I correct in believing that the UHFSDR requires only a LPF in exactly the same was as an active QSD/QDE? This is to prevent signals on the 2nd LO harmonic from mixing in both Rx and Tx?

If I'm understanding everything, then the only thing I still want is a 5W amp. Any suggestions? It'd be great to get a full 5W on 6M too. Has anyone used this: http://www.hfprojectsyahoo.com/sla5wamp.html

David:
The LPF is required on the output to attenuate the
harmonics(primarily odd). If you are in a strong signal area, a BPF on
the receiver input may be needed to reject signals at 1/3,1/5th. etc. freq.
The UHFSDR operates the same as other frequency converting SDR's such
as the Softrocks.
On my 350 MHz oscilloscope, the Si570 output at 2 meters is a
textbook squarewave.

The QRP2000 doesn't have enough pins to control the LPF.

I'm not sure the pe0fko firmware on the QRP2000 can control the MPLFP though. Has anyone played with the [DO NOT USE] commands and hacked this working? I'm fine with using MPLFP jumpers until I get a SoC board.

This passive I/Q mixer came as a bit of a surprise. I also like that the Si570 has isolation on the I2C side instead of destroying the output square wave in a transformer. I don't know much about the theory of operation except what I can absorb from the schematics. Am I correct in believing that the UHFSDR requires only a LPF in exactly the same was as an active QSD/QDE? This is to prevent signals on the 2nd LO harmonic from mixing in both Rx and Tx?

If I'm understanding everything, then the only thing I still want is a 5W amp. Any suggestions? It'd be great to get a full 5W on 6M too. Has anyone used this: _http://www.hfprojectsyahoo.com/sla5wamp.html_ (http://www.hfprojectsyahoo.com/sla5wamp.html)

Different question....

What's the consensus regarding cheapest toroids for the band pass filter?

Mike:
Duh, the subject was BPF build. I would think the choke and blocking
cap would work. The FST3251 switches do need to be biased at +2.5V
through the choke.

Dave,

If you do not mind answering, what did you use to layout your schematics? I am using Eagle Cad free version but can not find a HMC544 component nor what seems to be an alternative. Trying to layout a daughter board for the BPF/MPLPF switching using the HMC544 or AS169 but can't find either component availble in Eagle libraries. I can substitue something else but was just currious what you used. Sorry if you answered this previously as I could not find any posts on this.

Thank you,

Hank

The design was done in KiCad, which is free and open source. You can get it from http://kicad.sourceforge.net . Library completeness is not really a strong suit though, so I doubt you'll find one out in the open. It's pretty easy to make one yourself though, and maybe Dave will be kind enough to post it somewhere (or already has...).

Dave,

Thanks. That is what I thought as that component does not appear in Eagle libraries either. I picked another component with same foot print and just renamed it to AS169 but obviously makes the functionality of the schematic all wrong. I really just need the layout so I can etch some pcb's to play with. Thanks for quick reply.

Dave,

Sorry, at least one more question. On using seperate antenna paths and switching the antenna which I like the idea, reduces number of components compared to switching in/out the entire bpf/mplpf, probably less loss as well.

I see that H4 can be tied to ground to use seperate transmit/receive antenna but the only antenna in/out on the board I see is J4. What am I missing that is right in front of my face.

Hi Hank

I am using TP5 as a separate Tx o/p but a word of caution - there is then no capacitor from there to U7 - AS169 (HMC544), with the result that a DC voltage of c. 1V is fed out at a fairly high impedance - it drops to some 10's of mV with a 50ohm load. That fooled me at first when I was trying to measure the o/p Tx level with a DC coupled resistive bridge SWR meter. On a related subject, when I was building the UHFSDR there were two problems on the section on T/R RF Switching - one as mentioned before is the reverse logic of the AS169, and therefore, lines 204 and 212 which for the AS169 are "continuity" rather then "no continuity" in my case the continuity was "buzzing" on the meter - not sure if I had some 50Hz getting in. I ignored it and the Tx is OK.

Dave,

Thanks. Over looked the obvious. I though TP4/TP5 were just test points.....Of course I could pull the Rx/Tx out of those.... Oh do I feel silly.

Tony,

Thank you and i appreciate all info. I am going to try to use tp4/tp5 into short (<6") lengths of rg174 with couplers so that I can easily insert/remove both BPF and mplpf components hopefully making it a little easier to play with. I hope it dosent introduce too much loss. Was thinking to tie in rg174 shield to back of board like I did for p3/p4 jumper.

> I am using TP5 as a separate Tx o/p but a word of caution - there is then no capacitor from there to U7 - AS169 (HMC544), with the result that a DC voltage of c. 1V is fed out at a fairly high impedance - it drops to some 10's of mV with a 50ohm load. That fooled me at first when I was trying to measure the o/p Tx level with a DC coupled resistive bridge SWR meter. On a related subject, when I was building the UHFSDR there were two problems on the section on T/R RF Switching - one as mentioned before is the reverse logic of the AS169, and therefore, lines 204 and 212 which for the AS169 are "continuity" rather then "no continuity" in my case the continuity was "buzzing" on the meter - not sure if I had some 50Hz getting in. I ignored it and the Tx is OK.

Thanks, gentlemen. It sounds like I'm on the right track. I'm now thinking this UHFSDR might actually end up VHF but I want to check it out on HF first for sure.

I just ordered a Cypress PSoC dev kit. Going to try some DSP code on the PSoC-5. The napkin-math looks good so wish me luck.

There is another post I can't find that mentioned reducing R21 and R22
from 100K to 10K.
I made the mod and it reduced the noise floor.

It worked perfectly until recently when the the sound level has gone
down to quite a low level but the image rejection is still OK.

Has anyone experienced the same?

Alex:
The LVPECL version of the Si570 draws a max. of 130 mA. The lp2980 will not work as it is only rated for 50 mA. The lp2985 is rated at 150 mA and should work as long as you have the 3.3V version(-3.3 suffix).

It was working perfectly well over 24/7 for a number of weeks at least
then suddenly S9 signals were at the level of S3 but perfectly copyable.

It's either the MC33078 or the FST. When I get some time again I'll
change R21/R22 back to 100K and see how it's affected.

855. UHFSDR Si570 no control from HDsdr

Yahoo group: UHFSDR
Date: 2012-03-31 16:21:22 UTC
From: g.suggate
Topic: 855 Message: 855

Hello All,
I've got to the "test the rx" stage and find that I can change the freq of the Si570 (AAA000514G) using Si570.exe. However when I try HDSDR via the LPT wiring diagram on page 4 of the Assembly Instructions I get no freq. change. It just oscillates on 40mhz. I then tried PowerSDR-IQ using the connections on page 10 and 11, again with no freq change.

I assume the Si570 freq should change with these programs regardless of a working sound card?

I have read on other sites about dll files and "loading the Si570" but as I have no idea how to do that and it is not in the assembly instructions I have not tried anything else.

Any ideas please?

Geoff G3NPI Buckingham UK

Thanks Mike, I looked at the resistors and confirm they are 1k.
I also received a direct reply from G4CPE who provided the following info:-
In Power SDR IQ have you set the LPT address to 378 and Radio to SDR (Si570) ?
Also in the Hardware Config you will need to click (expert) then set Divider to 2 and in the (Max Freq Hz) add one extra 0 to the Freq.

After amending the settings as above the Power SDR IQ now changes the freq of the Si570.

As I am not yet receiving signals is there any other files or settings I need to know about?

Many thanks, I am now a step nearer completion.

Im not sure to which step in the build your at right now to answer your question ...

You can run SDRsharp while running powersdr .... sdr# is quite simple right now to listen to I/q from the UHFSDR - via the sound card. If you want to try to listen directly you can use a stereo jumper from the "out" to "in" and then put a standard 1/8" headphones into the headphone jack and hear something ... be it kinda quiet. I think that works when your near finished with the build. Do you remember what relays you received with the kit?

From: Gareth
Topic: 860 Message: 860

Hi there guys.
How could I protect my assembly of the UHFSDR kit from static by using a standard 25 watt soldering iron ?
Do you think I should ground out the main body of the soldering iron (metal part that holds the tip) but closer to the handle ??
Or should I really wait to get a ESD soldering iron ??
Any advice please much appreciated !!
Thanks 73's
Gareth 2E0GGO.

Gareth (and the list),

Not trying to rain on anyone's parade here but you can get all grades of Si570 and some synth kits that use them from www.sdr-kits.net.

I am quite interested in a UHF SDR kit without the Si570. I already have the partial kit to build but I can use 2, one for HF and one for VHF UHF.

ok , thats what i figured .. just googled it and
64.20 British pounds sterling = 101.8533 US dollars
And im only asking 65$ for a Si570BAA

Gareth (and the list),

Not trying to rain on anyone's parade here but you can get all grades of Si570 and some synth kits that use them from
www.sdr-kits.net.

I am quite interested in a UHF SDR kit without the Si570. I already have the partial kit to build but I can use 2, one for HF and one for VHF UHF.

Hi Alan

Please consider me in for a full UHF kit too, when soon funds become available. But, in the meantime, I would like a Si570 A please, Im in the UK too.

I will not be able to fill any further orders until the next batch of Si570's arrive in 6-7 weeks. If you are interested in ordering, I will continue to accept orders which I will fill and ship in the order received. Thanks to all who have supported this project in the past. In addition to the full SDR kits I am selling the UHFSDR 570s for $75. To reward those who order the si570s before they arrive I will sell them for $70 until the shipment is here.

Alan:

Just got my UHFSDR last week. Now gotta figure out how to hook it up, etc. Assuming all goes well, I will probably want another one for the rover station. Maybe in your next batch, but more likely in the one after that. (Gotta go easy on the radio $$ for a while!)

I am very impressed with the board, and read a very good article about frequency stability once warmed up. Thinking about mounting mine with a closed loop heater (like for 10 GHz gunnplexers) and inside insulation to minimize the temperature variation.

Will advise.

Thanks & 73,
Jim

Hello Mike,

Thanks for the info. I had not heard of SDRsharp.
UHFSDR now working on RX. Almost all problems with the RX section were caused by poor soldering. As I do not have much test equipment I had to skip some of the stage testing. Not surprisingly the SDR did not work on completion. I carefully checked for continuity between all components, re-soldered the poor joints and it came to life. You asked which relays I had, well the outer packet said HMC544 and I set the H5 strap for that type. When I started to investigate why I got no signal through the rx amp I discovered that in fact the relays were AS169 so reset the strap.
At this stage an S9 signal would produce a "fir tree" of signals every 2.5 khz or so. Buying an expensive sound card fixed this problem.
Now for the TX side: I am getting a very low level signal out. My power meter will read 100mw but does not move on the signal from the UHFSDR. The PowerSDR screen reads 200mw but that is not reading real rf output power. I know it is producing rf because I can hear it in a nearby rx. I am going to borrow a quality scope in the next couple of days, so if anybody has a guide as to what I should see at various points in the TX chain it would prove a great help in tracing this fault

Thank you for your comments Chuck. The problem was lack of gain but fortunately just because I had not turned the audio up enough.....

The PA Setting in my version of PowerSDR V1.19.20 I think. Does not have any adjustments. Anyway as I am now getting 50 mw out I cannot expect any more.

The last problem is how do I send CW with a straight key? Using the UHFSDR and Psdr. Has anybody got this working?
Many thanks

It's the same as for Softrock except for the si570 multiplier.
Alex did come up with firmware for the SDR-Widget that allowed it to
take x4 and interpret it as x2.

For UHFSDR I have a script that set the eeprom in the si570 so we always
get the x2 multiplier.

```
------------------- cut --------------------------
#!/bin/sh
usbsoftrock set si570_multiplier 0 0.5
usbsoftrock set si570_multiplier 1 0.5
usbsoftrock set si570_multiplier 2 0.5
usbsoftrock set si570_multiplier 3 0.5
usbsoftrock set si570_multiplier 4 0.5
usbsoftrock set si570_multiplier 5 0.5
usbsoftrock set si570_multiplier 6 0.5
usbsoftrock set si570_multiplier 7 0.5
usbsoftrock set si570_multiplier 8 0.5
------------------- cut --------------------------
```

These are per band settings.
73 ... Sid.

Topic: 878 Message: 881

In the python code, (on my XP system: C:\Python27\Lib\site-packages\quisk\softrock)change the /4 frequency lines (I believe they are commented that way) to /2. I think this is in the hardware_usb python file. If you're using one of the softrock AVR chips to control the Si570, PTT and so forth, this should work. I don't know if anyone has used Quisk with other controllers for the UHFSDR board.

883. Si570 exact part number

Yahoo group: UHFSDR
Date: 2012-04-28 00:42:04 UTC
From: Jim
Topic: 883 Message: 883

In researching the Silicon Labs website order page for Si570 I find that it requires entry of several parameters to define the exact part number. Does someone know if there is a specification callout on the UHFSDR schematic that defines U14 required parmeters? I ask this question because the Output Enable selection defaults to active high, but I don't know whether the available control software requires the enable to be active high or low. How about the tolerance, is +-20ppm required?

Thanks
Jim Brennan

For HF .. once its warmed up .. you will never notice ....
Unless its under a Heater/AC vent .....

There is not "call out" just a listing / reference for various part placements depending on the Si570 you have.

can you read the full part number on the Si570?? its the second line....

As far as teh Active high or low .. that depends on what you have for a Si570 and nothing to do with the firmware/software .. teh Si570 should be active all the time .. 100% duty cycle....

Most new Si570 have "active on" internally .. be it low or high enable.....

Does someone know if there is a specification callout on the UHFSDR schematic that defines U14 required parmeters? I ask this question because the Output Enable selection defaults to active high, but I don't know whether the available control software requires the enable to be active high or low. How about the tolerance, is +-20ppm required?

Thanks

Jim Brennan

Jim:
There is no call out on the schematic. The output enable is not controlled by any of the software that I know of. H2 on the UHFSDR can be set for either enable polarity. Either leave open or connect pins 1 and 2 for active high. Connect pins 2 and 3 if active low. This could be computer controlled, although I don't know of anyone who has done so. The default Output Enable selection is fine.
The IQ generation requires drivers with both Q and /Q outputs. That means LVDS, LVPECL. CMOS will not work. I recommend LVPECL.
The frequency grade depends on the maximum frequency(which is 1/2 of the Si570 freq) you want the UHFSDR to work at. You only need the expensive A grade if you want to operate at 70 cm and above.
The default frequency is up to you. I picked 19.982 MHz because I use PowerSDR-IQ which has a 9 KHz offset from center. With the divide by 2, the LO will be at 9.991MHz, which is 9 KHz from WWV at 10 MHz making it possible to check the UHFSDR without programming the Si570.
If you have a favorite frequency, pick 2X that frequency.

Hi Jim

The active "high" or "active low" is selectable by jumper H2. Either device will work. The other parameters are personal preference. The UHFSDR is very universal in it's design. Decide the stability and frequency range you desire and order accordingly. Follow the appropriate build note references. I prefer the AAA version as it will support full frequency range.

Hi Mike

I think the active High-low he is referring to is pin 2 "oe" pin. it is basicly a on off switch for the Si570. We don't use it but need to know the state the particular Si570 expects it to be.

Larry W9AMR

In a message dated 4/28/2012 3:09:53 A.M. Eastern Daylight Time, Patriot121@... writes:

For HF .. once its warmed up .. you will never notice ....
Unless its under a Heater/AC vent .....

There is not "call out" just a listing / reference for various part placements depending on the Si570 you have.

can you read the full part number on the Si570?? its the second line....

As far as teh Active high or low .. that depends on what you have for a Si570 and nothing to do with the firmware/software .. teh Si570 should be active all the time .. 100% duty cycle....

Most new Si570 have "active on" internally .. be it low or high enable.....

I screwed up in the file I sent you, it's a .tar.gz file not .tar.bz2.
There is a file that need to go in your home directory as .quisk_conf.py.
"quisk-3.6.1/quisk_conf.py_for_Softrock-G3VBV"
The email before that one mentioned it.
73 ... Sid.

If you are looking at the board from the side where H1, H3 and H2 are nearest you, with the si570 on the board, you would be reading the print, i.e

```
|---------------|
|SiLabs 570 |
|Axxxxxxx |
|---------------|

H2
ooo
```

You are looking from this side.
Hope that helps
73 ... Sid.

905. looking to use UHFSDR for education purpose

Yahoo group: UHFSDR
Date: 2012-05-07 22:34:21 UTC
From: tomshong
Topic: 905 Message: 905

Hi all,

I am trying to learn about the principles of RF/wireless communication systems, on my own. I am looking to find a job in that field, but while I have the theoretical background from my schooling, but I lack the hand on experience. I figured, in this economy, if I can't find a job gaining the experience, than I should try gain the experience on my own time and dime.

I'm wondering if playing with UHFSDR can be a good learning tool for my education needs.

My goal is to find a board that I can use to better understand the principle of operation of a RF system, that after I build it, I would be able to measure things such as gain, IIP3, MDS, Image rejection ratio, NyQuist sampling, etc, , and to tweak the board and compare how different waveforms affect its performance. I have limit lab resources; I have access to basic lab equipment such as oscilloscope and multi meter and signal generators. If needed I could afford a USB based spectrum/network analyzer such as one offered by Signal Hound for frequency/s-domain measurement., or get a National Instrument's MyDAQ student version.

I understand this is an amateur radio. As I do not have an amateur license yet, if this SDR does suits my needs, I plan to study up and get the license so I can undertake the said effort.

But before I start investing the time and money to undertake my self-guided journey, I am wondering, has anyone here tested out the RF performance of the board using a spectrum analyzer? and since I don't have any high end test equipment, can anyone tell me if it's feasible to test out its performance with the USB based solution I mentioned earlier?

Tom

Subject: [UHFSDR] looking to use UHFSDR for education purpose

Hi all,

I am trying to learn about the principles of RF/wireless communication systems, on my own. I am looking to find a job in that field, but while I have the theoretical background from my schooling, but I lack the hand on experience. I figured, in this economy, if I can't find a job gaining the experience, than I should try gain the experience on my own time and dime.

I'm wondering if playing with UHFSDR can be a good learning tool for my education needs.

My goal is to find a board that I can use to better understand the principle of operation of a RF system, that after I build it, I would be able to measure things such as gain, IIP3, MDS, Image rejection ratio, NyQuist sampling, etc, , and to tweak the board and compare how different waveforms affect its performance. I have limit lab resources; I have access to basic lab equipment such as oscilloscope and multi meter and signal generators. If needed I could afford a USB based spectrum/network analyzer such as one offered by Signal Hound for frequency/s-domain measurement., or get a National Instrument's MyDAQ student version.

I understand this is an amateur radio. As I do not have an amateur license yet, if this SDR does suits my needs, I plan to study up and get the license so I can undertake the said effort.

But before I start investing the time and money to undertake my self-guided journey, I am wondering, has anyone here tested out the RF performance of the board using a spectrum analyzer? and since I don't have any high end test equipment, can anyone tell me if it's feasible to test out its performance with the USB based solution I mentioned earlier?

It's not cheap but with your background the HiQSDR would go a long way as you would be dealing with the latest DDC/DUC SDR techniques, FPGA programming using Altera tools, studying the VHDL code which is quite readable as is the source code to the applications that allow it to be used as a transceiver, scope and VNA.
Check hiqsdr.org and http://dl2stg.de/stefan/hiqsdr/qsdr.html for the applications.
It's available as a kit and as a built unit.
73 ... Sid.

Yes, I am indeed trying to explore different options. Actually Dave Brainerd referred me to ask my questions here when I emailed him.

I have a MSEE, but my studies was focused on RF IC design. But, the actual design jobs are hard to come by without the right network and/or experience. Quite frankly I don't know if I am up to be part of the rat race working in a high tech firm entails. So for six years I end up as a system engineer doing upgrades on B-1B bombers in Boeing, where I spent a lot of time pushing papers and managing supplier, far removed from circuits. My job was cut when they moved my department to Oklahoma City (I am in California).

So here's my tentative plan, and I welcome any comments. for me to get a better handle of the SDR, first I will need to build up some knowledge on programming. I did some programming when I was in school, but my focus was mostly on circuit and device theories.

So firstly I plan spend $20 on learning programming embedded systems using this:

http://www.computersciencelab.com/

Once I am comfortable with coding, then I will either buy and play with UHFSDR or Softrock SDR.

It looks like i'd need an expensive spectrum analyzer in order to measure RF things like IIP3 and SFDR and phase noise. My budget will limit me to using Signal Hound or NI's MyDAQ. that is, if the board has test points for me to measure those things.

If I can not measuring RF parameters because of test tool limitation, then it looks like the best thing I can learn from playing with the SDRs is probably on the software domain; tweak the micro controller, FPGA, DSP etc.

If you guys recommend a good way to learn about FPGA/DSP/uC using these SDR boards, or if there's some simple tutorials out there, please let me know.

Also, is there any kind of portable cheap antenna that suits my needs? preferably something indoor so I don't need to put on the roof.

Thanks.

Tom

I've posted the same question on the softrockSDR group.

I can use some help with brainstorming some new ideas. if my goal is to get enough hands on practice so I'd be qualified for a job such as this one below (they are not hiring right now), what kind of things can I do with the UHFSDR with the resources readily available?

Is it possible to analyze the hardware? or do something with the software that will brush me up on C programming or concept with DSP?

I guess I am just looking to hear what everyone's experience is like with the SDR, and what they have done to build up their technical competency using this SDR.

Tom

Let's keep in touch for the future. Right now that group is not hiring. We lost AMF JTRS funding from Lockheed and the government and had some layoffs recently. Hopefully we get a win soon.

Good luck to you.

Nick

Design, development, test and integration support for advanced RF/Electronic hardware including transceivers, power amplifiers and antenna system products for military electronics system applications within HF/VHF/UHF/L/S/X/Ku and Ka Bands.

Work within a multi-discipline integrated product team environment.

Basic Qualifications:

Candidate must have X years of experience with analog and RF/microwave design.

Familiarity RF/Microwave engineering concepts:

RF architecture and system design including frequency planning, design partitioning, link and gain analysis, and electromagnetic effects.

Microstrip, coplanar waveguide or stripline implemented in RF PWB, LTCC and/or MMIC/RFIC technology.

Device modeling and characterization.

Design of filters, amplifiers, LNAs, PAs, mixers, VCOs, PLLs and synthesizers, power detectors and ADC/DAC technology.

Antenna design experience a plus.

Lab experience with test, measurement and integration of RF hardware and familiarity with common RF/Analog lab test equipment.

Tools / Software Knowledge:

Experience with AWR Microwave Office, Sonnet EM, Ansoft HFSS, PSPICE, HSPICE, Matlab, Labview, AutoCAD, Schematic Capture Tools.

BS/MS: EE or Physics

Jim:

The PCB holds an Si570 or any standard 3 X 5mm oscillator, has on board 3.3V regulator with power dropping resister, and a GTL2002 level converter for the I2L. Also, has footprints for 2 sma output connectors. Requires an external controller for the Si570. In the early Softrock days(before on board Si570) I sold about 600 of these kits.

Thanks.
Thinking about turning one into a signal generator. Lack of external reference is a deterrent.....Will keep thinking about it.

Jim:
The Si570 has an internal reference. You could use a 2nd Si570 board
with a fixed freq XTAL oscillator on it instead of an Si570.

923. Running watter popping

Yahoo group: UHFSDR
Date: 2012-05-21 20:53:43 UTC
From: MIKE DURKIN
Topic: 923 Message: 923

Ok ... so its time to track down a noise that I would describe as running watter with louder popping. Its been present since I built my first UHFSDR. The second does not exhibit this - duh.

So are there any ideas on what might be causing it.

Also during Rx does the speaker out have the same audio as what goes to the line-in of the soundcard?

Are there any sdr software that can show the left and right channel (I & Q) simultaneously to help narrow down a components issue or a voltage rail issue..??..

Mike KC7NOA

Bob:
The separate antennas connect to TP4 and TP5. I didn't have enough space to put in 2 more sma connectors. When using separate antennas, both switches in U7 are open.

Bob

A word of caution which I previously posted in March. Beware there is no coupling capacitor so the DC leakage of a volt or so from the analogue switches is passed straight to the o/p when you use TP4 or 5 - fooled me at first with a DC coupled SWR bridge.

Tony

934. SEAPAC presentation

Yahoo group: UHFSDR
Date: 2012-06-02 00:57:17 UTC
From: brainerdd
Topic: 934 Message: 934

A copy of the handout for my SEAPAC presentation is at
<www.wb6dhw.com/UHF-SDR/WB6DHW_DIY_Handout.doc>
A copy of the slides is at
<http://www.wb6dhw.com/UHF-SDR/UHFSDR.ppt>
Note that some computer display the schematic slides very poorly. The schematic slides are the UHFSDR schematic pages that are available from the UHFSDR section of the For_Sale page on the website.
I will add links to the presentation files when I return home on Monday(I don't have the software on the notebook).

Topic: 935 Message: 936

The UHFSDR covers 2M/6M/4M without modification. Suitable LPF's for the transmit and BPF for the receive would be required. The BPF board could be used on those bands with a filter re-design. My MPLPF board already has a 6M filter. a 2M and 4M lpf could replace 2 of the lower frequency filters.

On the AQRP group NO5K has put up some notes and pictures of his UHFSDR2GO.

As Dave says for the UHFSDR LPF's and BPF's are all that are required
though I have a preference for transmitting BPF's to kill the 2 birds
with one stone for ham band only use.

Ok ... I don't know what it was .... but it looks like it's gone.

I had swapped out the offending board (my first built) with the second I had built using my toaster oven.
I fugered It wouldnt hurt much to put the miss behaveing board in the toaster - lightly sprayed with liquid flux. I did think it a good idea to remove the micro coax that was placed on the bottom and the stereo connectors. They didn't look to be able withstand the heat of the toaster.

My UHFSDR/Widget is on the net with dspserver and you can hear a pulsed tone.
It's powered by 13.8V --> LM338 providing the +5V.

I tried a ferrite ring on the lead to the Widget and got an even more horrible noise, then I tried just a 220nF cap across the lead which had no effect.

Later this evening I I'll try a larger ferrite ring + capacitor to see if I can clean it up.

If it's not that the other culprit could be the LCD which has a couple of turns on 3/4" diameter by 3/4" long ferrite ring, the same as I have done for the SR63ng/Mobo/Widget - to be investigated.

Has anyone else experienced similar?
73 ... Sid.

I am using my UHFSDR on 70 mhz. By direct comparison with Transverters (28mhz to 70mhz) the sensitivity of SDR appears 10 to 15 db lower.
In fact no increase in noise is apparent when connecting an aerial.
I have checked the RX preamp which seems OK.
So is this normal ? or have I a problem somewhere else?
Many thanks in advance

I though the list would be interested to know that Dave's talk has been posted on Youtube by the ARRL. Thanks for the presentation Dave.

What candy tin?
I like candy and an enclosure as a bonus!

BTY, sdr2go works ok for stand alone controller/sound ...

Dave shipped the UHFSDR with the candy tin, Alan does not.
I preferred to build mine in a larger box with the SDR-Widget with its
LCD display and room for a small amplifier and transmitting BPF's.

I think there is a picture of the UHFSDR in the tin, in the UHFSDR group
photos section and may be the docs package.

I tried a 15W PA from an old transceiver project connected directly to the HMC482, it went into oscillation and it damaged the HMC482. I thought the PA was 50 ohm in/out but there must have been a mismatch so next go I'll put in a 3dB attenuator and feed a 1W preamp --> 5W PA and see how that goes.
The 15W PA includes a preamp so it only needs 23mV to drive it to full output.
All the above PA's worked for many years in the homebrew transceiver. I replaced the 5W and 100W with the 15W and drove a 200W solidstate PA.

I also have the K5BCQ 20W PA built and tested so I could use that UHFSDR --> 1W preamp --> 20W PA.

Too many projects on hand so I'll schedule a day when I attend to that.
There is also a second UHFSDR to be hooked up to a SDR2GO and test.

Yahoo group: UHFSDR
Date: 2012-06-10 02:07:58 UTC
From: The Silver Fox
Topic: 899 Message: 960

If people think it would be a plus, I can add the case into the kits for what may be a small increase. My personal opinion is that there isn’t enough interest to do it since many people are interfacing the board with other outboard capabilities such as amps and filters.

73,

Alan – W6ARH

Subject: Re: [UHFSDR] Re: Dayton

I know ... he dosent send the case though .... I seem to think I bought a bd and mini kit (maybe not the mini) .... Im looking for a case ....

I looked at the altoids a few hours ago ... its just too small. Then seen a makeup kit for kids ... 12$ ....

I don't know ....

From: MIKE DURKIN
Topic: 954 Message: 962

Hey Dave WB6DHW,
How much more of a loss would there you think if I used a ADT1-1WT on the bandpass filter?

Its listed as 75ohm ... I think the ADT1-1 is 50ohm (not sure) ...

While novel it's not practical long term unless you're making a modular setup. So I would agree. The tin is not very rugged.

Hello All,

Regarding an enclosure for this great SDR. Please see my message No. 699 entitled " UHFSDR in Eddystone Die Cast Box ". There are pictures in the files section. (Sorry for that, I should have put them in the PHOTOS section).
The case is just perfect for this project. As you shall read, I have incorporated a USB front end. Dave, Please ,Please add these few components to any revised PCB layout. I want to make a few more of the UHFSDR design.
Thanks.
Regards to you all.

Mike:
I don't think there would be much affect. The actual bandwidth of
the transformer will be different with 50 ohms rather than 75.

Ok ... I don't have any way to check those kind of things .... the WT seems to have slightly better loss across the operating range ... but 75ohms ....

Found a bunch of WT's on fleePay for about 5$ each ..... probably fakes.

968. Starter guide for DSP software

Yahoo group: UHFSDR
Date: 2012-06-11 09:10:47 UTC
From: vk3nx
Topic: 968 Message: 968

Hi guys, I am pleased to say that I have finished my build of the UHF SDR and so far everything "checked out " OK. I am up to the stage where I have hooked it up to the computer and using Power SDR IQ I seem to be controlling the Si570 and am actually hearing and generating RF as per the excellent manual. I have several issues such as constant "popping sounds" and I can see "image" frequencies moving across the spectrum as I tune. I am having a very hard time resolving stations... I am sure all of these issues are related to my lack of undertstanding on the setup of power SDR IQ.....

Is there a "quick start guide" or is there an easier program that I should use to "cut my teeth on".

Many thanks
Charlie

Hi Bob,
I think you could do no better than contact Sam, G4DDK. He is on the web. He may also have a colleague in the USA who supplys them. The mod in my opinion completely transforms the performance of the receiver.

Topic: 968 Message: 970

Images are usually caused by either I or Q missing. Check your cabling to the sound card.
Line In should be stereo which is not the case with some laptops if you are using one.
73 ... Sid.

Topic: 714 Message: 971

I am planning on augmenting the kit with this component. It will raise the cost of the kit by $4.00. Any gripes about doing this?

73,

Alan - W6ARH

Hi Bob,
I think you could do no better than contact Sam, G4DDK. He is on the web. He may also have a colleague in the USA who supplys them. The mod in my opinion completely transforms the performance of the receiver.
Regards Ed GM3SBC

NO!!!!!!
I'd have GLADLY paid $4 more!

AND, if you're willing to sell individual parts to those who bought
older kits, I (and I bet others) would be grateful!

Thanks & 73,
Jim

Including the chip in the kit adds $4 to the cost of the kit. Selling it separately is more expensive due to packaging and shipping costs. An often overlooked cost for US customers is the shipping and state taxes added to my purchase costs.

So, I would need about $6 for US and $7 for DX. Please let me know and I will bulk order some chips.

73,

Alan - W6ARH

I would also order one of the chips also and retrofit my board. As far as $4 more for the kit, it would not stop me from buying the kit.

Try SdrSharp .... with no Rf front end setup in SdrSharp. Use CFGSR to tune around (Si570??).

I would agree with Sid

Sounds like a image problem. What version of PSDR are your using? The newest version has auto image adjustment. I use v1.12 under XP and it is adjustable. Look under setup/dsp/image reject. The adjustment is a little touchy. I use the mouse wheel to adjust. If you can get image rejection there or it has auto rejection try grounding one side or the other (one at a time). The RX will stop working on the channel that is working. Time saver way to check it if you don't have a scope.

Larry W9AMR

Images are usually caused by either I or Q missing. Check your cabling to the sound card.
Line In should be stereo which is not the case with some laptops if you are using one.
73 ... Sid.

Unless you touch somewhere else on the UHFSDR, grounding the Audio leads is pretty harmless. But I should have added a disclaimer "do at your own risk!"

In Ed's original post he also mentioned replacing R3 (120 ohm) with a 100nH inductor.
Is part of the improvement dependent on this?

There were no responses to Ed asking for verification of his results. I'd especially like to see what values of R, R in series with L, or L alone are recommended - or the effect of having the SPF5043Z without changing R3, especially at say 3.5MHz and at VHF/UHF which is Ed's deployment.

Topic: 968 Message: 988

Hi guys, thanks for all the comments and suggestions.
Today I had a good look at the setup.
I am still unable to get rid of the images. I rechecked the board and the "line out" sigs. As per the build manual with the Si570 operating at it's default frequency of 19.982MHz I inject a signal of 10.01MHz into the antenna port and on the Line Out channels I have 10 KHz signal 90 degrees apart. So I think my board is OK(?)
I tried everything in Power SDR (latest version)to do with image rejection and no improvement. I tried swapping the I Q lines also
I removed (shorted) one channel at a time and found NO difference. My conclusion is that the "stereo" line in on the "Realtek Sound card" may not be so stereo..... Is this the correct inference? I then tried my Sound blaster xfi external USB sound card and had exactly the same results.

A couple of questions.....
1. If the I and Q on the UHF SDR line out boards are 90 degrees out of phase can I conclude that I have the board operating correctly? Ithink so but perhaps I am missing something.
2. Has anyone any experience with the Realtek sound cards and the Sound Blaster XFI external USB units.....Are any of these adequate for an SDR? If not what should I invest my money in?

Many thanks in advance for your help

Charlie:
What A/D card are you using. Some cards require setting an offset
between the I and Q.

Hi Dave,
I'm not sure! Do you mean on the UHF_SDR board or in the confuser?
I can open up the confuser and hopefully see which chip is on the soundcard.
Were do I cahnge the "offset correcton"? Is that the "IQ" correction in the PSDR setup tabs?

Many Thanks
73
Charlie

Yes, somewhere in the SDR software. I don't remember where,
however. Check some of the old messages in the Softrock40 group. Lots
of discussion on it.

Hi Charlie

Look on the setup/audio tab and there should be a IQ corr (correction) box.
Some of the Soundblaster cards require it.

If you are using a laptop most don't have a stereo line it. Check the sound
control panel and if it does make sure stereo is selected.

This may be all old news if you have tried this. But hopefully it helps in
some way.

993. UHFSDR Kit step 72 not changing frequency

Yahoo group: UHFSDR
Date: 2012-06-15 06:25:41 UTC
From: Jim
Topic: 993 Message: 993

I have a problem with the Si570 not changing frequency when programmed to do so. Has anyone else run into this problem in step 72? After many hours of troubleshooting I conclude that there is either something wrong with my Si570 chip, or the program Si570.exe (and compiled version). One problem along the way was that the PC parallel port pin-14 (Autofeed) does not have sufficient current sourcing for U13 (ADUM1251), so I am using a 3.3 v battery pack.

The SDA and SCL i2c signals at the Si570 look ok on my scope. I was able to get the source code for Si570.c and compile it. I verified that the ACK was being generated following Slave Address, Byte Address, and Data writes. I even changed the code to allow reading of some registers and the SDA line could be seen with data coming back from the Si570.

The problem is that the frequency remains fixed at the default (close to 20MHz) and does not change when a value is entered in the GUI. Has anyone had this experience in building the kit? Does anyone have source code for a PIC that could be used to test the Si570 operation?

Thanks and 73,
Jim Brennan KJ6VRI

I'm not sure if it's the same problem you're having or something else, but my ADuM1251 is definietly not working. I've currently got my I2C controller hooked up directly to the Si570 and it's working that way.

In my case the problem seems to be that the ADuM1251 works in the controller->Si570 direction, but the ACKs do not get forwarded back. As in your case, the signals on the Si570 look normal, but the missing ACK is noticed on the controller side. Try comparing the two SDA pins on the ADuM, they should be identical, if not you're having a similar problem as me. Probably also worth trying the controller hooked directly to the Si570 test points (mind that the maximum voltage here is probably 3.3V) just to make sure it's not a software/interface problem.

I've not yet had a chance to cut the chip off the board and replace it, but I'm pretty confident that's where the problem lies, there's really no other explanation for it.

Hi Larry and Dave...
I have tried the "IQ correction".....but perhaps a bit "hastily" so I will try to make small adjustments and check if this helps.

I also tried "Rocky" and the "image" 18 kHz away, is still there and is obvious as I tune signals.

Can I just confirm something..... If my I and Q channels on the J2 connector are 90 degrees out of phase..... which they are as measured on my oscilloscope, then the UHF_SDR board is all OK and nothing else needs checking?
Also confirm please that the UHF_SDR does use X2 LO as opposed to X4 as most other programs like rocky need?

Thanks again guys for your help. I am sure I have built the board OK and I can tune signals but the image is "annoying"..... Also I see that there is a real "hump" around the centre frequncy many dB's above the noise floo, several kHz wide and "notched" at the centre..... Is this right?

Very well done.
The only thing I never liked has been the coax link above the board
seems like it could get in the way and I've mounted it underneath on my
2 builds.

I also had a similar problem when I first ran my board from HPSDR-IQ with the parallel port interface. I posted on this group and it was suggested to be careful of the quality of the i2c signals. They looked ok on a scope but the Si570 sometimes worked and sometimes stayed on the default frequency. I changed the connexion between the PC and UHFSDR from single wires to screened coax and have never had a problem since.

Jim,
It appears you may be beyond this point but iy might be worth checking again- borrowing from the Softrock group, many (or most) instances of no frequency agility of the SI570 are due to improper soldering of the pads- particularly the ends. If you head over to that yahoo group and read the posts regarding this topic you will see many similar accounts.

Subject: [UHFSDR] UHFSDR Kit step 72 not changing frequency

I have a problem with the Si570 not changing frequency when programmed to do so. Has anyone else run into this problem in step 72? After many hours of troubleshooting I conclude that there is either something wrong with my Si570 chip, or the program Si570.exe (and compiled version). One problem along the way was that the PC parallel port pin-14 (Autofeed) does not have sufficient current sourcing for U13 (ADUM1251), so I am using a 3.3 v battery pack.

The SDA and SCL i2c signals at the Si570 look ok on my scope. I was able to get the source code for Si570.c and compile it. I verified that the ACK was being generated following Slave Address, Byte Address, and Data writes. I even changed the code to allow reading of some registers and the SDA line could be seen with data coming back from the Si570.

The problem is that the frequency remains fixed at the default (close to 20MHz) and does not change when a value is entered in the GUI. Has anyone had this experience in building the kit? Does anyone have source code for a PIC that could be used to test the Si570 operation?

Thanks and 73,
Jim Brennan KJ6VRI

Hello Sid,

I will chime in on your comment, I also put a small RG178, coax jumper on

the bottom side. I didn't like it on top, on my two completed UHFSDR

radio's. They are both completed and running. What a fantastic radio.

Very well done.
The only thing I never liked has been the coax link above the board seems like it could get in the way and I've mounted it underneath on my 2 builds.

I totally agree, above board it looks like an unwanted appendage.

Yesterday I replaced the BGA612 with a SPF-5043ZDS the second one
leaving the 120 Ohm resistor in place but I haven't done any testing,
waiting on a Widget which should appear in a few days.

On the first one I have removed the LM7804 and replaced it with an off
board LM338 with a heatsink and fan to power the UHFSDR and Widget.
773 ... Sid.

1003. Re: [UHFSDR] UHFSDR Kit step 72 not changing frequency

Yahoo group: UHFSDR
Date: 2012-06-15 15:50:03 UTC
From: MIKE DURKIN
Topic: 993 Message: 1003

Do you have more than one set of pullup resistors between the controller and AduM1251 ? You only want one set. I remove/omit the pullup resistors on the UHFSDR, the ones between the AdUm1251 and the header, keeping the pullup on the controller pcb.

Subject: Re: [UHFSDR] UHFSDR Kit step 72 not changing frequency

I'm not sure if it's the same problem you're having or something else, but my ADuM1251 is definietly not working. I've currently got my I2C controller hooked up directly to the Si570 and it's working that way.

In my case the problem seems to be that the ADuM1251 works in the controller->Si570 direction, but the ACKs do not get forwarded back. As in your case, the signals on the Si570 look normal, but the missing ACK is noticed on the controller side. Try comparing the two SDA pins on the ADuM, they should be identical, if not you're having a similar problem as me. Probably also worth trying the controller hooked directly to the Si570 test points (mind that the maximum voltage here is probably 3.3V) just to make sure it's not a software/interface problem.

I've not yet had a chance to cut the chip off the board and replace it, but I'm pretty confident that's where the problem lies, there's really no other explanation for it.

1004. My new SDR using UHFSDR+USB2SDR

Yahoo group: UHFSDR
Date: 2012-06-15 17:16:26 UTC
From: SW1IXP
Topic: 1004 Message: 1004

Hi all!

I have just uploaded some photos in the photos section of this group (My UHFSDR+USB2SDR by SV1IXP). It is my new homebrewed transceiver covering 160 to 10 meters with 100W (and very soon it will cover 2m and 70cm, I am working on it right now). Shortly I will also post a general description of my setup.

Charlie:
Two signals 90 degrees apart and equal amplitude indicate the UHFSDR is working correctly. The UHF_SDR does use X2.
The hump is an indication of a ground loop.
Sounds like only one channel is going through the sound card.

1006. Re: UHFSDR Kit step 72 not changing frequency

Yahoo group: UHFSDR
Date: 2012-06-15 17:35:15 UTC
From: Jim
Topic: 993 Message: 1006

Mike, I am using only one set of pullups between AdUm1251 and header. The header is connected to the PC parallel port. I was not seeing ACKs out of the Si570 so I put 0.001uF caps across the 1K pullups (R61 and R62) between AdUm1251 - Si570, and finally did get the ACKs. So there was some unseen glitching on the output side of AdUm1251. Since I am now getting ACKs back with Slave and Byte addresses, it appears that part of the software/hardware is working. As mentioned earler, I tried register reads (in my re-compiled program) and got data back from the Si570 as monitored on the SDA line at TP2.

Keenan, you have a controller that can be hooked directly to the Si570 for testing and this would be a good way to confirm everything (ACKs and operation) works. I am using a PC Parallel port, so will try comparing the ACKs out of Si570 and AdUm1251 back to PC (to test the AdUm1251), but I don't think that this is my problem. The program Si570.exe (as well as the compiled version) are a one-way write to the Si570. I am beginning to think, as you, that the Si570 needs replacement. This task might be tricky, however. I wicked all solder off of the part but it still sticks to the PCB. The Si570 spec sheet states (Table 10) that maximum soldering temp Tpeak is 260 C for 20 to 40 seconds. I used regular solder and temp of 300 C. This may be the cause of my problems. The soldering temperature should be noted in the assembly instructions. At this point all continuity and all signals still get to the gold cutouts on the side of part so I will retry my testing. I would like to try a controller vs. PC, where can I get that board?

Jim,
I lifted this from the softrock group. If nothing else it may aid you in removing the chip-usually the SI570 is not the least bit fragile.

I am building an Ensemble RX VHF unit.
After completing the USB/LO stage,
I have encountered a no frequency control problem.
I went through all the CFGSR tests with no success.
Then, I used My hot-air gun to heat the Si570 area
to make sure that the chip pads are soldered correctly.
That has solved the problem.
I have decided to share that information, in order
to support the notion: "most of the problems are with soldering the Si570 chip".
Good luck to all the builders!

1010. Re: [UHFSDR] Re: UHFSDR Kit step 72 not changing frequency

Yahoo group: UHFSDR
Date: 2012-06-15 17:49:47 UTC
From: Keenan Tims
Topic: 993 Message: 1010

I am using a simple ATtiny85 circuit modified (ie. simplified) from that used in the Softrock USB-I2C with the PE0FKO firmware. It's basically just the AVR, a 3V3 reg and the USB connector so I built it on proto board.

http://wb5rvz.com/sdr/usb_i2c/
http://pe0fko.nl/SR-V9-Si570/

You'll need an AVR programmer though, or maybe you can buy preprogrammed chips somewhere.

My Si570 saw a lot of abuse during soldering and seems to work normally, so I don't think you'd have destroyed it that easily.

Im using a QRP2000 pcb with a replacement AVR with PE0FKO 15.15 firmware to controll a Si570 on a UHFSDR !!!! Ill soon be selling the QRP2000 with the PE0FKO15.15 as soon as i get a cloned UBW32 running .... Mike KC7NOATo: UHFSDR@yahoogroups.com
From: jimbr99@...
Date: Fri, 15 Jun 2012 17:35:15 +0000
Subject: [UHFSDR] Re: UHFSDR Kit step 72 not changing frequency

Mike, I am using only one set of pullups between AdUm1251 and header. The header is connected to the PC parallel port. I was not seeing ACKs out of the Si570 so I put 0.001uF caps across the 1K pullups (R61 and R62) between AdUm1251 - Si570, and finally did get the ACKs. So there was some unseen glitching on the output side of AdUm1251. Since I am now getting ACKs back with Slave and Byte addresses, it appears that part of the software/hardware is working. As mentioned earler, I tried register reads (in my re-compiled program) and got data back from the Si570 as monitored on the SDA line at TP2.

Keenan, you have a controller that can be hooked directly to the Si570 for testing and this would be a good way to confirm everything (ACKs and operation) works. I am using a PC Parallel port, so will try comparing the ACKs out of Si570 and AdUm1251 back to PC (to test the AdUm1251), but I don't think that this is my problem. The program Si570.exe (as well as the compiled version) are a one-way write to the Si570. I am beginning to think, as you, that the Si570 needs replacement. This task might be tricky, however. I wicked all solder off of the part but it still sticks to the PCB. The Si570 spec sheet states (Table 10) that maximum soldering temp Tpeak is 260 C for 20 to 40 seconds. I used regular solder and temp of 300 C. This may be the cause of my problems. The soldering temperature should be noted in the assembly instructions. At this point all continuity and all signals still get to the gold cutouts on the side of part so I will retry my testing. I would like to try a controller vs. PC, where can I get that board?

Hi Dave, Fabulous! That information is a BIG help to me.Thanks very much. I will explore the sound card part of the problem further. I feel confident that the board is working correctly as I have also built up an SDR as a panadapter for my FT2000 and am seeing exactly the same problems.

I am new to this stuff, and the learning curve s steep but a lot of fun.... the advice from the group has been invaluable.....

From: sv1obt
Topic: 1004 Message: 1013

Hi,

I am working towards a complete rig too. I haven't done anything for 2m and 70cm yet, but I do have the 1.4GHz si570 and looking forward to build an all-band SDR rig.
My hardware configuration is the following
USB2SDR codec board
UHFSDR
a homebrew BPF filter for 10m-12m only (just for tests at the moment)
a 10w linear amp.
a custom TX/RX switching circuit.

regards
Dimitris

Software Defined Radio, a successful story

This transceiver is a successful implementation based on the core of UHFSDR (by WB6DHW)plus USB2SDR boards (by SV1EIA). It covers all the HF bands with 100W of transmitting power (in the near future it will also cover 2 meters and 70 centimeters with 50W of power).
In the HF receiving section there are six bandpass filters (octave, 7 poles) by WB6DHW. In the transmitting section there is the driver section consisting of the QRPProjects QRP-PA 2008 which is followed by the AN762 (by Communication Concepts) power amplifier. The PA output is then low pass filtered by the HFProjects LPF. The output from the LPF board is then connected to the T/R relay which is a common signal relay. The antenna connector is a PL. The interconnecting coaxial cable is RG-174 terminated with SMA connectors. All the control signals are derived from the USB2SDR board (PTT, filter selection, local oscillator frequency).
A great emphasis has been placed on the intergrated modular construction of the radio. The enclosure is custom built from 1mm sheet metal and is painted black. There is the minimal amount of input-output connectors consisting of the power input in the back (uses Anderson Powerpole chassis connectors) and the usb connectivity (from USB2SDR to the PC which runs PowerSdr-IQ) as well as a ¼ stereo TRS connector for the final audio output (coming from USB2SDR). In the front there is a RJ-45 connector for the microphone which also accepts a morse key (straight or paddled) which ends at the USB2SDR board again and an illuminated power button. All the connectors are of high quality from NEUTRIK.
Internally the enclosure is divided into 3 compartments. The lower compartment hosts the UHFSDR and the USB2SDR boards. The middle compartment hosts the HF boards. The upper will host the V/U part of the radio (preamps, Pa’s and signal switching).The HF PA protrudes from the middle compartment due to size.
All the boards are enclosed in shielded boxes with sma connectors for the rf signaling and DB9’s for the control signals.
I will post a more detailed description+new pictures when time allows it! Thanks for your reading!

1017. Re: Starter guide for DSP software

Yahoo group: UHFSDR
Date: 2012-06-18 09:52:09 UTC
From: vk3nx
Topic: 968 Message: 1017

Hi Dave and others following this thread (read: tale of woe!)

Well..success!!
It was a faulty audio cable connector that was inadvaertently shorting out the I and Q channels. A quick change out and everything is behaving as it should.

I ran the SDR # program and that was a big help in understanding the image problem. It also helped me see that a lot of the "crud" on the display was because I was overdriving the sound card. according to SDR# I have only a small fraction of a degree difference B/W the I and Q being 90 deg apart....

I spent several hrs playing with Power SDR and getting a feel for what it can do and am now very satisfied.

Thanks Dave for all your help (and the design work!!) and to everyone else for their suggestions in fault finiding.....

HI all!

To anyone that it is interested, I am having success with the 2m version of YU1AW's LNA using the BFG540X (the version with the 2 input coils for improved selectivity). My sensitivity has been greatly improved and now it is in par with my IC-910 (I dont have the gear to make measurements, it is a subjective observation)

Too many projects on the go Rune.

I replaced the BGA612 with a SPF5043Z on one UHFSDR leaving the rest of
the circuit as-is but I haven't got around to checking it out yet as my
USB sound cards are a pain so I'm waiting any day now to get a
SDR-Widget to use with it.
I would like to see how it performs at HF before swapping out the BGA612
on the other one.
73 ... Sid.

1026. Re: UHFSDR Sensitivity

Yahoo group: UHFSDR
Date: 2012-06-23 15:13:50 UTC
From: g.suggate
Topic: 944 Message: 1026

Hi Ed,

Many thanks for the info. I have obtained an SPF5043 [although it says 1G4K on the chip] and fitted it without replacing the 120 ohm resistor, because I did not have one!.
Tests showed a further 3db loss of signal. I then made up a 100nf choke to replace the 120ohm resistor with the same result. I then experimented with different values of choke and a value around 1000nf gave a 6db improvement. ie 3db above the original chip/ resistor combo. I have done DC checks from Ant In to the Chip In all seems OK apart from 3 ohms through the switch, which I am assuming is normal.
My questions now are:-
1. Does your noise floor raise when you plug in an aerial? Mine does not.
2. Have I got the right chip?

Hoping you can help

Hi Geoff,

The 1G4K marking is correct. The noise floor does increase by several dBs when I connect a antenna on the VHF/UHF bands. On the LF bands the noise increases by about 15 / 20 dB depending on the time of day etc.
I presume that you have observed the part placement. On the SPF5034 you must rotate the IC by 180 degrees compared the the original part fitted. Ie the input and output functions are reversed with reference to the WIDE pin. So the wide pin of the SPF5034 should be in the position diagonally opposite to where the wide pin of the old device resided.

BTW to all, I fitted a bandpass filter for 7 and 10 Mhz and gave the UHFSDR a try. Extremely good , in fact amazing performance. I then compared it with the Softrock Ensemble TXRX. The UHFSDR outperforms. I also noticed that with the Softrock it picked up a huge signal from my mobile phone when it was transmitting, the UHFSDR does not respond , an excellent result. All in all, this little radio is a cracker ! I demonstrated the UHFSDR to a fellow ham recently, he was totally impressed.

Geoff, hope that helps. The resistor / inductor arrangement I used provides a wideband performance with the resistor dictating the Low Frequency gain which is more than adequate consistent with ensuring that there is sufficient DC voltage supplied to the SPF5034. The DC bias voltage on the output is a little less than the recommended value for peak performance. However the part works very well at the bias value chosen. With the original resistor value of 120 ohm the bias voltage would be too low for the part to operate properly.
Best Regards
Ed GM3SBC

At the moment I'm using manually switched BPF's for RX and TX.
I am coming around to the idea of using such filters at 100W, much
cheaper than separate BPF's for RX and LPF's for TX.

Hello Ed,

For goodness sake, what is the bias/supply network you use with the new SPF5034 ampfor the data reported??

I (rudely) have left all the blah-blah-blah in this thread simply because it's possible that I have missed some obscure reference to the supply network values and I need someone to point that out.

Please, when referring to previously written info, please, please give the summary component/ frequency values so that we mere mortals can follow the dialog and, hopefully, the on-line fun!

Other than Ed's replacement of the bias resistor with a 100nH inductor I have no idea what was then changed to produce the gain/ bandwidth/ noise values reported here. I would love to follow along but I guess I'm missing the boat somewhere...

Thanks and greetings from Florida

Jeff Thompson

Hi all,
In my setup for the transmit section i use the LPF-100 R3A:
http://site.hfprojectsyahoo.com/low_pass_filters
For the receive section I use this: http://wb6dhw.com/BPF.html
These of course for the HF bands.

Hi all,

Larry W9AMR recently built this and he has a fully functional 160-10M HF transceiver with 5W output. There is a single USB connection to the PC for both the IQ audio and rig control (Si570, band switching, T/R switching, Fan control etc.) He is planning to add a VHF PA portion to extend the freq range.

Larry is prepared to share the details of his project with others in the UHFSDR forum but he was not able to post. Maybe the list moderator can contact him if there is interest?

Hi all,

Larry W9AMR recently built this and he has a fully functional 160-10M HF transceiver with 5W output. There is a single USB connection to the PC for both the IQ audio and rig control (Si570, band switching, T/R switching, Fan control etc.) He is planning to add a VHF PA portion to extend the freq range.

Larry is prepared to share the details of his project with others in the UHFSDR forum but he was not able to post. Maybe the list moderator can contact him if there is interest?

From: w9amr@aol.com
Topic: 1039 Message: 1041

Hi All, here is the info I wrote a long time ago.

First off, ****DO THIS AT YOUR OWN RISK!**** Now that I scared you read on...

How to setup a MOBO to be driven with any Softrock or a "UHFSDR".

There are probably better ways to do this. But this works for me! The Mobo has a interesting input switching circuitry. Very clever and ideal for the 6.3(NG) We need to make a few changes. The mods are reversible no foil cutting necessary. If you use the UHFSDR I don't think the stock mobo firmware will work. I am using the Widget for a controller. Loftur or Art could answer that question. I am sure it could be modified if there were enough interested. There are other controllers that might work?

I run the 12v+ to the input on the 5v regulator and ground to the ground pin. Add a 470mfd cap to the input.

Remove C12 C17

Lift pin 9 on U8 and jumper the lifted IC pin 9 to pin 7 on same IC

P19 Pin1, S12V goes in here.

I2C, P13 goes to UHFSDR H2.

Radio antenna goes to Pin 9 U8 put a .1 cap in series with it. 25-50v rating is plenty.

TX antenna goes to P15 Pin 1 or 5

RX Antenna goes to P17

Use a double pole double throw relay use 1 half for antenna switching and the other to do something else if needed sequential keying for bias an such?. You could make up a ciruit using BS170 just like the 6.3 uses but I think the relay is easier and less prone to failure in the future. And the relay gives more flexabilty.

I need to test it a bit more and make sure it is 100%! So far no issues. I am using the Widget V.005 unified version.

I have a lot more to do to the project. When I am done I hope to go 160m to 2m. I will have more and better info coming shortly. It is not as hard as it looks to interface the MOBO to other projects. Take time to make sure your wiring is correct. Use the schematic to understand what I have don't Have fun with it!!!

From: Dave
Topic: 1029 Message: 1042

Rune:
After power up, all outputs of the 8574 are high and will cause all
relays to be energized. For manual operation, you need to ground all of
TP1 to TP7 except the output going to the filter you want switched in.
If you are planning on operating the board manually or with something
like the mobo that uses bcd lines for control, I have a little board
that will replace the 9574.

Hey

Understand that grounding TP1>TP7 will do the job. I found the diagram of the board and will P1, P3,P4 serve as "manual" BCD input A0,A1,A2 I have to repeat myself about BCD code have not done this for the last 22 Years :-)But yes I remember, 3 variable in BCD you could count up to 7. Need to find my old electronic book from school and repeat some of my stuff.

The latest Widget firmware that Alex issued allows x4 to be sent but interpreted as x2 for the UHFSDR.
Under Linux this script stores the correct per-band multiplier in EEPROM. I don't know how it's done in Windows.

```
------------------------------- CUT
--------------------------------------------
#!/bin/sh
usbsoftrock set si570_multiplier 0 0.5
usbsoftrock set si570_multiplier 1 0.5
usbsoftrock set si570_multiplier 2 0.5
usbsoftrock set si570_multiplier 3 0.5
usbsoftrock set si570_multiplier 4 0.5
usbsoftrock set si570_multiplier 5 0.5
usbsoftrock set si570_multiplier 6 0.5
usbsoftrock set si570_multiplier 7 0.5
usbsoftrock set si570_multiplier 8 0.5
------------------------------ CUT
---------------------------------------------
```

From: g.suggate
Topic: 944 Message: 1045

Hi Ed

Thanks for the reply.

It shows I still have a problem.

I note you refer to a "resistor/inductor arrangement" where I mistakingly thought the 120 ohm resistor was replaced by the inductor.

So the next question is; what value resistor and is it in series with the inductor? and will I have damaged the chip by incorrectly biasing it?

Yes I did make sure the new chip was put in reversed....

The resistor / inductor arrangement I used provides a wideband performance with the resistor dictating the Low Frequency gain which is more than adequate consistent with ensuring that there is sufficient DC voltage supplied to the SPF5034. The DC bias voltage on the output is a little less than the recommended value for peak performance. However the part works very well at the bias value chosen. With the original resistor value of 120 ohm the bias voltage would be too low for the part to operate properly.

Yes. I have components to create the kits for anyone who would like to order one. There is a two to three week backlog of kit orders at the moment. I lost about a week of time doing Field Day. The kits are $200 USD and $204 for DX orders. Customs requires a phone number for DX customs forms. Payment is via paypal to my email address.

From: firedjl
Topic: 1055 Message: 1055

Ok, you all are my last hope. I can't get past the first construction step. getting 2.7v at the output of the 3.3 regulator. I have done the following:
used 3 different u12 chips,
checked all leads for continuity and shorts,
have 5 v at both chip input pins (at the chip housing entry),
checked the voltages right at the chip leads including the ground and bypasss,
checked for oscillation on the chip output with a good scope,
used proper flux and silver bearing solder (no acid flux,)
cleaned up with flux remover,
all joints nice and shiny and beaded properly, no cold joints
I'm going nuts! Stumped! and I know it's probably a flat forehead error...
any suggestions?
Thanks.
Don
(my first kit build an Eico vtvm, 1952? 53? and built many since then, including smt's)

The low output could be something overloading the output. The regulator responds by lowering the output. Try lifting the output pin and checking. Also, ensure the chip grounds are good(with power off, use a continuity checker between the pins and ground).

Ok, breadboarded one of the batch of regulators on a schmartboard, with some ridiculous caps to get the same values, .01, 10 and 10 uf and get 3.3 volts. used same solder and flux pen. Still stammagasted and going more nuts...

Thanks Dave and Kees. I'll check the overload, but the circuit as a whole is drawing only 3 ma from a 12v supply. Would it do that under a foldback? The parts are straight from digikey and are from two different orders. part number is exactly right according to the packaging.

Foldback would be above 250mA.

1062. Re: an appeal

Yahoo group: UHFSDR
Date: 2012-06-30 22:25:39 UTC
From: firedjl
Topic: 1055 Message: 1062

the saga continues. I put in a whacking great to-220 3.3 v regulator and all traces and caps are ok, I get 3.3 v. A really reaching question. With the regulator out of the circuit, and c41 in place, I get about 400k resistance between the regulator trace for the bypass c41 and ground. Should this be? seems to me should indicate open. all traces are clean etc.
If moderator or others are tired of this tread just say so and I'll quit.
thanks
Don

Oh, I haven't populated anything except step 1 in the build document. I probably won't be using an SI570 to start, but an external source. So there's nothing there but r1,ui and associated caps, which is working just fine, and u12 and associated caps, which I'm wrestling with, and FB1.

measured 400k resistance across c41 with the regulator out of circuit. the regulator specs say that this could be too low. will remove c41 and check to see why this resistance is there.

last ditch fix, there must have been tiny crack in the common lead to the regulator and c41,42. tiny wire fixed it.
Anyhow, 3.3 v with and without 1k load. Hopefully smooth from here!
hanks for the suggestions. It looks ugly, but it works...

From: Sid Boyce
Topic: 1055 Message: 1073

When I built the first one I had a similar issue with U17 pin 4. There was a discontinuity between the via on the bottom of the board and the same via on the top. A wire from the underside of the via through the via to pin 4 fixed it.

However after having the si570A CLK+ fail about a month later followed by CLK- some weeks later and 2 other 570A's DOA I finally got one from George Boudreau that worked and still works.

The curious thing was that the discontinuity had disappeared, may be with all the heat I applied in replacing the bad si570's. The R's and C's between the si570A and U17 and the wire had shifted when using the hot air gun.
73 ... Sid.

km5h.softrockradio.com sells the lower speed grade chips. If you're using the UHFSDR on HF, that chip should be good enough.

Glen:
Lower speed chips are OK as long as they have 2 outputs(ie LVDS, LVPECL, etc). The CMOS will not work as the UHFSDR needs both outputs to produce the quadrature signals.

1090. Keying board from PC

Yahoo group: UHFSDR
Date: 2012-07-17 15:55:15 UTC
From: JOS C
Topic: 1090 Message: 1090

When keying the UHFSDR when using a PC with LPT1
I noticed while doing some test that U4 receive MMIC Vcc was not switching off when the PC was in transmit. Since most modern PC's use 3.3 volt logic on the LPT1 leads that the board required 5.0 volts and I didn't want to build up another circuit plus the rest of the TX keying worked OK.
I modified the U4 control circuit as follows.
Remove diode D1 from board add new in4148 diode or similar with anode
connected to Q7 (FET) gate and the cathode connected to U6 pins 3&4.
this will provide the necessary 5v when in the TX mode.
Note: I use the AS159/169 switches if the HMC544 is used you may have to connect to U6 pins 8&13 instead of 3&4.

1092. ADUM1251 Step 45 problem - help please

Yahoo group: UHFSDR
Date: 2012-07-20 19:06:04 UTC
From: Chris
Topic: 1092 Message: 1092

Hi everyone,
I am new to this group and have been trying to read up on advice while waiting for my kit to arrive.
Now I have got as far as Step 45 and need advice. All checks and measurements up to this point are OK. But I get 4.91v on H1-3 when grounding TP2.
I have tried reflowing all legs of the ADUM1251. Then checked resistance between legs and any components they connect to. Checked values of all surrounding components - no luck. If I disconnect TP2 from ground H1-3 still shows 4.91v.
Before I send off for a new ADUM does anyone have any other suggestions please?
73 Chris G0IMX

1093. RX I/Q phase and gain results

Yahoo group: UHFSDR
Date: 2012-07-24 20:55:10 UTC
From: JOS C
Topic: 1093 Message: 1093

Recently I finished my second build of this project. I was involved with the first board testing. some of the parts were removed from the old board to save money and time. For example I used different mixers as I had them in stock and didn't plan on anything higher than 2meters. I used two sound cards for testing A Sound Blaster 24 live USB for the signal input and the on board sound for TX and the speaker.
When first doing receiver checks I use ROCKY this program can provide a graphical display of the receiver phase and gain errors I was surprised to see a large phase and gain error with some strange looking hooks on the display. After doing some experiments I modified the circuit slightly to try to improve things. The largest mprovement was realized by simply bridging a 10ufd tantalum capacitor in parallel wit each of the following capacitors C57 C58 C21 C71. Additionally I modified some other component values for further phase and gain improvement. Please check photo section under WA9CGZ foR results.

Anyone on list that has a good signal generator with level control interested in doing some before and after test after adding the capacitors? from what I can tell is that the mixer terminating varies with the the I/Q frequency because of the coupling capacitor value is only .1UFD.

Now the disclaimer I'm not a engineer but have good test equipment and their could be other issues caused by my changes on my board. I removed the temporary tantalum capacitors and replaced the .1's with 10ufd chips.

Joe wa9cgz

1094. Re: ADUM1251 Step 45 problem - help please

Yahoo group: UHFSDR
Date: 2012-07-25 10:31:47 UTC
From: Chris
Topic: 1092 Message: 1094

Well..... without any suggestions from the group I have replaced the U13 chip (ADUM1251) and tested again. All checks 32-43 are fine but again not Step 45. This time I get a different voltage - 1.5v. Wow - things are getting better - I wonder how many times I need to replace the chip before it gets down below 0.82v reading?
I cannot think of anything else to try so I will just carry on with the Si570 install and see what happens. In the meantime if anyone has had this problem before and solved it please speak up.

To: UHFSDR@yahoogroups.com
Subject: [UHFSDR] UHFSDR Sensitivity Improvement

Hello All you UHFSDR lovers,

I decided to do some further measurements of the MDS on my UHFSDR.

I started by measuring the UHFSDR unmodified in the following set up conditions:

Software: WRplus
PC: ASPIRE One Net book
Signal Generator: HP with additional Microwave attenuators.
Mode : CW
Frequency: 144.300 Mhz
Bandwidth: 500Hz
AGC:Off

The result for 1 dB signal above noise power : -133dBm.

I then decided to change U4 (BGA612) to a different type of MMIC, the SPF5043Z. This is a 50 Mhz to 4 Ghz part with high dynamic range. It has a lower noise figure and higher gain than the BGA612.
The mod was simple, remove the BGA612, install the SPF5043Z taking care to check the different orientation and replace R3 (120 ohm)with a 100nH Inductor.

The result for 1 dB signal above noise power : -145dBm

So if you want a super sensitive VHF/UHF front end, you got it !

Only possible down side is that the IC starts to degrade below 50 Mhz. It could still be adequate for the DC bands if you really must use the UHFSDR for that purpose.

What a remarkable little radio this is.

Regards

Ed GM3SBC

Hi Ed,

Do you have any data for the 'DC' bands NF with the new SPF5043Z? I
do a lot on 40/ 20m and I would hate to wreck the UHFSDR for 40/ 20m
while improving 6/ 2m/ 70cm performance. Your thoughts??

73 & Thanks,

Jeff W3HVU

Do you still have some of those devices for sale? Or was that a different device?

Just ordered the last pice I need (power supply for atlas/ozy/etc.) to get it on the air.

Thanks & 73,

My price is $4 a chip plus $3 shipping. The $3 charge only applies to the purchase not the number of chips. That is, the cost to ship multiples is still $3.

Thanks.
Let me get what I have going, and I'll go from there. I don't need the additional sensitivity, (this will be IF for my microwave stack) but like the lower NF and higher dynamic range.

From: Ed
Topic: 1100 Message: 1105

Hi Jeff,

Please see my posts on UHFSDR Sensitivity Improvement, Message Numbers 714, 719 and 733.

I use my UHFSDR on all the " Low Bands " as well as VHF , the performance is very good indeed. Each band requires a Bandpass Filter to be fitted on the RX input.
You shall find that if you use a large antenna for the LF bands you may require an attenuator in the evenings when there are VERY strong commercial broadcast stations present. I regularly use up to 20 dB in series with the antenna for this purpose.
During the day the sensitivity is always limited by the external noise level and not the UHFSDR.

Regards Ed GM3SBC

From: Jim Sanford
Topic: 1100 Message: 1107

All:

I am getting close to attempting to hook up my UHFSDR. I'd like to use the HPSDR Janus/Ozy as the interface, which leads to several questions:
1. Has anyone done this already? If so, what were connections between HPSDR boards and UHFSDR, and what were configuration settings in PowerSDR-IQ.
2 I saw a note recently which suggested that transmit audio could be provided from the PC and receive audio sent to the PC with the result that only connection between PC and UHFSDR was the USB cable. How was this achieved?
3. Has anyone tried extending the length of the USB link by using the available USB-to-Ethernet and Ethernet-to-USB boxes? How did this work out?

My interest is in being able to remote UHFSDR about 300 feet away where my tower is, and then use it as the IF for my microwave stack.

Thanks & 73,
Jim

Sid:
Thanks. I'm aware of those. USB2SDR is a bit pricey, and I'm not sure
about the other. I was really hoping to use what I already have.

Thanks & 73,

Hi Mike.

The widget is in the 165-170 dollar range if I remember right, It is a kit!
It is much cheaper then the USB2SDR that was priced around 330.00 last I
new.

Both have there selling good points. The USB2SDR is not a kit. It is
based around Windows platform and PSDR. The Widget is a bit more universal. and
works under Linux and Windows. Widget was intended to be used with the Mobo
but I have interfaced it with many types of SDR's. I am glad to share the
info. Both are are fun.

Larry W9AMR

Hi Larry,
I'm hoping to clear desk space sometime this week to test SDR-Widget number 3 with the second UHFSDR which has the BA612 replaced by the SPF-5043ZDS.

I have been tied up winding toroids for the HiQSDR Preselector BPF's which are now all in place and waiting for clarification of the strapping options as the circuit diagram I'm using is for a V2.6I board and I have a V2.6J which seems to have been changed but no V2.6J circuit diagram is available.

In my last conversation with George it was mentioned he had enough stock
to do a few more kit's.

Sid: Let me know how your project goes!

OK Larry,
It'll probably a while before I can turn my attention to the second UHFSDR+ Widget.

Last night I hooked up the HiQSDR Presector to the HiQSDR and tuned across a number of bands using QtRadio. It has been up on the net from last night.

I still have some more testing to do before soldering in the BPF screens and drilling holes for the SMA connectors on both ends, 2 on the end not shown in the photo and soldering the BPF/PA enclosure which consists of 2 L shaped sections and top and bottom covers so the whole unit is screened and separate from the HiQSDR.

I've yet to etch a couple of small PCB's for the RF Return Loss Bridge so I can use the unit as a VNA to measure shape and insertion loss of the BPF's.

In this photo the 10W PA (available soon) is installed on the left. I am using the 1W PA that's plugged into the underside. Later due will be the 100W PA and case for the whole transceiver.

Hi all !

Larry have your sdr-widget/uhfsdr no running and had a JT65 contact Wirth UA3ARC in 20-Meter already with 100mW and he copied me with -11 :-)

Really nice rig.

I am unsure what to do.

1) Simply connect a amp and 50/144 filters (replacable) or

2) connect a second to build mobo?

Larry would it be possible to run the mobo up to 50/144 with of course custom filters switched by the mobo board?

Topic: 1100 Message: 1120

Hi,

Just popping in to say my opinion.
I went for the USB2SDR.
Got really interested from Eric KC5YOE work in
http://ntms.org/files/KC4YOE_UHFSDR-USB2SDR.pdf
because I'm active in VHF/UHF and higher bands up to microwaves too.

I wanted easy setup and operation with PowerSDR and it proved really good.
Regarding price, USB2SDR has double codecs so it contains
two stereo inputs and two stereo outputs to hook appart from rig's IQ,
my mic and my headphones (the way PowerSDR wants it in supported modes)
at 192KHz, factory made.
So it payed up by saving me from having a second audio card or any
setup trouble.
Of course I'm very happy with the result which you can see at
http://groups.yahoo.com/group/UHFSDR/files/SV1IXP/

UHFSDR + USB2SDR + BPF/LPF + 100WPA HF/VHF/UHF

1121. SV: [UHFSDR] UHFSDR connections

Yahoo group: UHFSDR
Date: 2012-07-31 23:17:04 UTC
From: Flemming Nielsen
Topic: 1121 Message: 1121

Hi Oliver.

About mobo and UHf-sdr ! For about 1½ year ago I made some tests with the mobo and uhf-sdr . It`s works fine on hf and 6m and 4m but on 144Mhz there was a problem with the 16Mhz x-tal osc on the mobo , frekvens 9*16,003 = 144,027 noisy :-(  . Maybe It`s better with the widget . The widget , do have 2 clocks 12,2Mhz and 12 Mhz . 12,00? Mhz = 12x12 = 144Mhz and I` m afraid that you also will have a rest of harmonic there . If your are making som tests , It could bee interresting to hear your conclusion. You can better make a isolation between the mobo and widget .

73 vy oz5agk / Flemming

Ps. you need more gain before the mobo because the switches. eks . http://www.g4ddk.com/SPFAMP.pdf I have build 2 of them and the works very fine.
(for use in my 4 bands transverter)

Emne: Re: [UHFSDR] UHFSDR connections

Hi all !
Larry have your sdr-widget/uhfsdr no running and had a JT65 contact Wirth UA3ARC in 20-Meter already with 100mW and he copied me with -11 :-)
Really nice rig.
I am unsure what to do.
1) Simply connect a amp and 50/144 filters (replacable) or
2) connect a second to build mobo?
Larry would it be possible to run the mobo up to 50/144 with of course custom filters switched by the mobo board?

Hi Oliver

I am glad to hear it's all running well. I have tinkered with the Mobo a little at 6m. output is a little low but useable. For 2 meters I the UHFSDR in to a 2m PA module with great luck! I have some that are from a hand held walkie talkie. The ones I have run at 7.5v's. There are all kinds of power modules. Some that require as little as 1mw drive.

At the moment the widget seems to hit a brick wall around 365Mhz. I believe it will take a firmware change to resolve that. Beyond my abilities. I have not tinkered with my MOBO/UHFSDR setup in a while. I have a few more ideals to tinker with when I have time. I think the mobo is going to be usable to 6m with a little work.

Using switching to bypass mobo 50Mhz and above and PA modules at 144,220 and 440 might work. The PCF8574 will handle the switching crossover point up to 144Mhz. I don't think the board layout and design of the Mobo will efficiently handle Vhf above 54Mhz. I could be wrong but I haven't (yet) pushed it that far.

OK Larry,
It'll probably a while before I can turn my attention to the second UHFSDR+ Widget.

Last night I hooked up the HiQSDR Presector to the HiQSDR and tuned across a number of bands using QtRadio. It has been up on the net from last night.

I still have some more testing to do before soldering in the BPF screens and drilling holes for the SMA connectors on both ends, 2 on the end not shown in the photo and soldering the BPF/PA enclosure which consists of 2 L shaped sections and top and bottom covers so the whole unit is screened and separate from the HiQSDR.

I've yet to etch a couple of small PCB's for the RF Return Loss Bridge so I can use the unit as a VNA to measure shape and insertion loss of the BPF's.

In this photo the 10W PA (available soon) is installed on the left. I am using the 1W PA that's plugged into the underside. Later due will be the 100W PA and case for the whole transceiver.

Man thanks Flemming, Costas and Larry for you helpful tips. Only thing i can say so far is that i do not want to miss the mobo extra functions.

maybe i will come up with something in the middle, with at least 50 MHz

In quantity per piece they are pennies but distributors sell in packs of 25, 100 or 250 some don't do COG / NP0 on the higher values.

Surplus places I've looked at don't have all the needed values.

You really only need the capacitors. You can wind the inductors on miniature T20-6 and FT23-61 cores and probably get higher Q than using SMD inductors.

These are the needed capacitor values and quantities for a six range band pass filter for 1.8 to 30 MHz

0.0047 270 0.0018 0.0068 820 0.0027 0.0024 0.0033 150 0.001 0.0039 510 0.0015
2 1 1 1 1 1 2 3 1 3 1 2 2

110 560 330 0.0012 56 390 220 680 750 39 120 24 120 68
1 1 1 2 1 3 3 1 1 1 2 1 2 1

Sorry the formatting on the SMD capacitor list didn't work - looked fine in draft

1132. Mitsubishi Mosfet Power Modules

Yahoo group: UHFSDR
Date: 2012-08-08 17:51:29 UTC
From: Oliver Goldenstein
Topic: 1132 Message: 1132

Hi All !

Inspired by Kostas 2 Meter and 70 cm Module i looked around for circuits for the Mitsubishi Power Modules.

I have a RA08H1317 8 Watt Power module for round about 26 Euro.

http://www.box73.de/download/bauelemente/RA08H1317M.pdf

The Datasheet says:

"This module is designed for non-linear FM modulation, but may also be used for linear modulation by setting the drain quiescent current with the gate voltage and controlling the output power with the input power."

...

"b) Linear AM modulation:
By RF input power Pin.
The gate voltage is used to set the drain’s quiescent current for the required linearity.
"

1) http://www.minikits.com.au/kits7.html#ra08h1317m

looks like non linear

2) http://www.byonics.com/ma3

non linear for aprs fm but has a interesting power sensing circuit

3) http://www.hamtv.com/pdffiles/PA5-20m.pdf

described as ... "Build a 50mw in / 25 Watts p.e.p. out, linear all mode amp and drive from ..."

4) http://site.hfprojectsyahoo.com/vhf_packer_6m_amp

6-Meter VHF Packer amp. Circuit looks like non linear, but description says:

"*MITSUBISHI RF MOSFET MODULE *mounted on a heat sink. The RA30H0608M is a 30-watt RF MOSFET Amplifier Module for 12.5-volt mobile radios that operate in the 66- to 88-MHz range. SSB, CW and FM Operation. Also works well at 50MHz."

So it looks easy to hook up a PA with such power modules. But i want it to use with SSB and CW on 50 MHz / 144 MHz / 440 MHz. And i am i but confused now.

Maybe i am a bit wrong in understanding linear and non-linear mode.

Do some of you have experiences using one of this modules?

Kosta could you give some more details of your used circuit? i thought one of your first qso's was on 2 Meter SSB?

Any tips and suggestions welcome.

OK...found some more following this blog from a softrock friend :-)

http://www.k8gu.com/?p=1027

he cloned the circuit from the elecraft xv series.

http://www.elecraft.com/XV/XV.htm

manual with circuit is here:

http://www.elecraft.com/manual/XV%20Transverter%20Owner%27s%20Manual%20Rev%20F.pdf

i think i will try one of these first.

1135. Re: [UHFSDR] WB6DHW Band Pass Filter Board

Yahoo group: UHFSDR
Date: 2012-08-08 21:06:10 UTC
From: jeff@123jeff.com
Topic: 1100 Message: 1135

I have been playing a bit with the factory-rolled inductors vs the hand-rolled toroid equivalents. IMHO, Coilcraft makes about the best of the lot for these SMD type coils. However, the Q and R-equiv for these gems just doesn't stack up to well wound toroids. No news there for anyone, I'm sure.

Also, most of the SMD coils are solenoid form factor. This leads to both coil coupling and Q-killing from nearby conductors over larger distances than might be expected.

By using pre-made inductors a mighty annoying part of filter making (toroid winding) can be avoided. However, be ready for higher filter insertion losses and, perhaps, odd skirt profiles. A bit of hand-diddling may improve the picture a lot.

So in that regard, also buy a cheep assortment of SMD 0804 size ceramic chip capacitors on ebay for handy tuning & tweaking. For about $50 you can get a lifetime supply of small caps in the 2.2pf thru 0.1mf range. Also purchase AT LEAST an AADE LC Meter-2B meter for good measurements! (You needed one anyway, right?). Caps have pretty sloppy precision specs - enough to really clobber a nice, tight filter design.

AADE also has a pretty good filter design tool on their site that certainly merits your attention if you're going to play with this stuff. It's quite good and it's free as well. Pretty impressive. See it at:

www.aade.com

...just a very satisfied user.

My $.02 worth of opinion...

Jeff Thompson, W3HVU

It is a nice little board, useful on many SDR frontends. Any idea roughly what the parts cost is ? Might be a good opportunity for someone to jump in and provide kits.....maybe for more than 6 bands and you select the bands you want to use or use multiple boards. 73

I notice there is a R1 version of the BPF board David has with holes in the pads for toroids and a non R1 version without the holes. Which one are you shipping David ? Does anyone have a picture of one with small toroids ? Really seems like a useful layout without any extra parts I wouldn't be using anyway.....maybe add a low NF switcheable MMIC and make it 80m-6m. 73 Kees K5BCQ

Hi Kees,

I have both of the boards you are asking about. There are a few different docs of that filter
that have been optimize and use different parts than those listed. Some of the docs are about @5 pages long. Alot of time was spent on squeezing the max performance out of it.

I figure T25-2 and T25-6 toroids are around $0.12 each so that's not too bad, bulk buying 1:1 transformers ought to be $1 each, the FET switches you need to find and the NPO/COG caps. 73 Kees K5BCQ

Kees:
I am shipping the R1 version with the holes for toroid leads. Just
got 100 of them.
The BPF boards with the smd inductors have 5 to 6 dB in band loss.
Skirts are good. Loss using the toroids is 2 to 3 dB less due to the
higher Q.

Kees:

I am shipping the R1 version with the holes for toroid leads.
Just got 100 of them.

The BPF boards with the smd inductors have 5 to 6 dB in band
loss. Skirts are good. Loss using the toroids is 2 to 3 dB less
due to the higher Q.

Dave - WB6DHW

<http://wb6dhw.com>

I have been playing a bit with the factory-rolled
inductors vs the

hand-rolled toroid equivalents. IMHO, Coilcraft makes
about the best

of the lot for these SMD type coils. However, the Q and R-equiv for

these gems just doesn't stack up to well wound toroids. No news there

for anyone, I'm sure.

Also, most of the SMD coils are solenoid form factor. This leads to

both coil coupling and Q-killing from nearby conductors over larger

distances than might be expected.

By using pre-made inductors a mighty annoying part of filter making

(toroid winding) can be avoided. However, be ready for higher filter

insertion losses and, perhaps, odd skirt profiles. A bit of

hand-diddling may improve the picture a lot.

So in that regard, also buy a cheep assortment of SMD 0804 size

ceramic chip capacitors on ebay for handy tuning & tweaking. For

about $50 you can get a lifetime supply of small caps in the 2.2pf

thru 0.1mf range. Also purchase AT LEAST an AADE LC Meter-2B meter

for good measurements! (You needed one anyway, right?). Caps have

pretty sloppy precision specs - enough to really clobber a nice, tight

filter design.

AADE also has a pretty good filter design tool on their site that

certainly merits your attention if you're going to play with this

stuff. It's quite good and it's free as well. Pretty impressive.

See it at:

www.aade.com

...just a very satisfied user.

My $.02 worth of opinion...

Jeff Thompson, W3HVU

It is a nice little board, useful on many SDR
frontends. Any idea

roughly what the parts cost is ? Might be a good
opportunity for

someone to jump in and provide kits.....maybe for
more than 6 bands

and you select the bands you want to use or use
multiple boards. 73

Hi Kees,

I have both of the boards you are asking about. There are a few different docs of that filter
that have been optimize and use different parts than those listed. Some of the docs are about @5 pages long. Alot of time was spent on squeezing the max performance out of it.

Lately, it seems as though the interest in kits has waned worldwide.
Is this a lack of interest, competetion with vacations, or impact from
financial impacts?
Just curious as to what' s happening.

It makes me sad that I did not know about hams and SDR when I lived in Austin. Lived there for 25 years and left in 2008. Got my General in 2007 and played with VHF for a couple of years until I got bored with Walkie-talkies. Started HF on softrocks in 2009 and been totally involved since then. Sorry I missed out on the great ham community in Austin for so long.

Hi all,

Yes both modules (RA08H1317 and RA60H1317 as I used) can both be used for linear modes (SSB,AM). Their datasheets are not always very clear about this (I was also confused when I first started searching...). I used such modules because they are very very easy to work with. I also took inspiration by commercial PAs out there (eg. http://www.ha1ya.hu/htmkepek/me2tprofoto.htm) in the design of mine. I will upload the details on the files section although it is very simple in construction.

RA60H1317 - 60W for 40$ ... not bad.

Dosent look like its posted yet..

Is there a UHF Equivalent? Wonder how far out of the band you can take it?.?

Many thanks Kostas for pointing that out.

I ordered a Kit with parts (ex Mitsubishi brick) from
http://www.minikits.com.au/kits7.html for the 8 Watt module i own.

Michael at the provided link you see a list of availabe modules.

From 50MHz up to 23cm they are available up to 60 Watts. But it depends.
But it depends.

From: v321uk
Topic: 1100 Message: 1160

Kees,

Do you have any plans to do a kit of BPF components? I already have the later PCB with holes for the inductors and would be interested in a set of cores and capacitors for 160m to 10m. I can get them locally from Farnell but it means I'll be buying more than I need for 1 or 2 BPF boards.

73's
John G3UGY

--- In UHFSDR@yahoogroups.com, "Kees & Sandy" <windy10605@...> wrote:
>
> To cut the turns count down a little and use slightly larger devices (smaller fingers was not an option), you can use BN-43-2402 cores for the larger values (low end of the bands) and T-25-2 and T-25-6 toroids for the smaller values .....and mount them on the back of the board so they don't interfere with the capacitors. I ought to wire one up and have some testing done. The cost of the BN and T-25 cores should be around $0.12 each so that's only $5 for all 42 inductors. The NPO capacitors are cheap and I figure <$5 for the remaining parts, buy the boards in bulk from Dave, add a little for "shipping in" costs, state taxes, and PayPal fees, and put a complete BPF Kit together for $25 plus $2-3 postage in the USA, a few dollars more for DX. Offer the option ? .....of 160m to 10m, or 80m to 6m for the six bands...or do something with the 2 extra selects. I think those cores would take 500mW or maybe 1W.....mmm Just some low cost ideas.....a nice WB6DHW High Q BPF Kit for HF frequencies could be used anywhere. Maybe someone could come up with a VHF/UHF verson but there are so many variables ...too many. 73 Kees K5BCQ

Topic: 1166 Message: 1166

All:

I had asked this once before, but it was buried in a bunch of other questions. Although I've received suggestions on USB2SDR et al, I'm seeking anyone who has hooked up UHFSDR to the TAPR Ozy and Janus boards, which emulate a high performance USB sound card, among other things. If anyone has, I'd like to hear from you about connections, pitfalls, etc.

USB2SDR etc. are all very impressive and promising, but I'd like to at least take a shot at what I already have.

Thanks & 73,
Jim

That particular one has 2 more positions which are presently unused, no reason why you can't "daughter board" another 2 "you select the band" on if you want. But you have to see what that does from a signal integrity standpoint. And to answer your question, sure there are different FETs available but I like the layout Dave has used for this one. 73 Kees K5BCQ

Subject: [UHFSDR] Re: BPF Experiences

Hi Kees, I have the board but have yet to get the components. I have been really busy here kitting QRSS beacons so have not found the time to source the components. I guess a complete kit would have been better for me. 73s Steve G0XAR

I just looked at the datasheet for the mux and don't see a spec for the frequency it will pass or the attenuation vs freq. Two hints are the .25nS delay from input to output(tht would imply several hundred MHz) and the capacitance. Some of the bpf's on the board could be re-designed for different bands using the same layout. Should be able to do at least 6 AND 2m without changing the layout IF the mux will work with those freqs. There also should be other analog muxes with the same pinout. I know I have seen some that will pass 70 cm, but don't remember if the pinout was compatable.

If you want more than 6 bands and, as Dave thinks, the switch is good to mid-vhf, you could cascade to a second BPF board with 6 more layouts with the unused positions on the switch.

From: Oliver Goldenstein
Topic: 1174 Message: 1174

Hi All!

Due to our soon arriving child i had to finish my winter projects yet.

I ever wanted to move my UHFSDR to a real enclosure and have i fully functional on CW and of course have transmitt working.

The pictures are at:

http://groups.yahoo.com/group/UHFSDR --> Photos --> DL6KBG

I you have questions, feel free to ask me. Yet i have no time to write a big description.

Some of the circuits have been discussed at SDR-Widget and UHFSDR before.

Thanks to Larry for his isolated PTT circuit and Graeme for having CW working with the UHFSDR-Widget and Mobo-Widget.

What a nice little rig.

Thanks also to Dave and Alan for part support and making the kit available.

And all other that helped me with previous asked questions.

Hi Dave
I was just looking at the logic around U6 and U7 and see that Tx o/p is switched to the common ant connector when H4 is shorted to ground for separate ant. This means that only TP4 needs to be connected to an antenna socket for Rx via a capacitor for DC isolation, and the common antenna connection can be used for Tx. Have I misread something here?

Topic: 930 Message: 1177

Dave,

I didn't want to ask this, as it's probably a pretty dumb question, but I have been looking at my completed UHFSDR and BPF filter boards working up to connecting them. It's always easier to ask the question then fix the mistake.... :)

I follow Tony's comments and the schematic related to grounding H4 and using the common SMA connector from the board instead of TP5 for Tx.

What I don't understand is TP4 connecting to the Rx antenna. I would run a cap for isolation from TP4 to center of another panel mounted sma connector but can I get the RF ground from anywhere on the board? That is what I am not sure of. I assume this is correct and I can probably tie into ground near the common Tx sma connector already on the board by scratching off some of the board mask like I did for the P3/P4 connection, but I wanted to ask first.

Can you give me some guidance? Much appreciated.

On the BPF board I used smt coils from coil craft and if I ever find the second BPF board I bought I might for fun try to use manually wound coils for fun. I am sure the smt based board will be find for my needs, but you have to keep busy you know!

Hank:
You should be able to get the RF from anywhere on the ground plane.
I would avoid the area near the Si570 and the divider chips. Near TP4
or TP5 is probably best.

Topic: 930 Message: 1180

Hi Hank

I discovered that next to TP4 there is a silk screened circle around a via - this appears to be ground and perhaps Dave intended it to be used for just this purpose. The silk screen printing is slightly confusing there, so I got my DVM out to confirm that TP4 is correct and the circled via is ground. in fact I am using a 0.01uF disc ceramic to connect to TP4, and picking up ground from the original antenna connection 1 cm away.

It is indeed a fine radio. I put my first signals out on the 4m band here in the UK yesterday with a RD30HVF1 MOSFET giving between 10 and 15W driven straight from the UHFSDR. All I had to add was an old mobile radio band pass filter and an old aerial changeover relay in a tobacco tin! (plus an antenna) Battling with a few PA stability problems but I am very impressed.

ps I meant to say as well that I am picking up the switched 12V for Tx direct from Q5 collector to feed the aerial changeover relay and bias for the MOSFET PA.

Tony,

Thank you, yes I had seen that via also. I was going to use a short piece of RG174 but did not think that that hole was large enought to get a substantial ground for the braid so I figured I would scrape off some of the ground mask on the back and tie in RG174 braid, using TP4 for the center conductor. Then I was going to mount a daughter board with an SMA just next to the UHFSDR. Then I can use the same idea to tie in Dave's BPF filter board into Rx stream.

It's coming together.

Tony,

You wouldn't happen to have a schematic and parts you are using for the Tx relay that you could share with me. I haven't started looking at the Tx switching part yet as I am just trying to get the receive with band switching working.

Right now I am running it with a LPT port which works but I kringe when I look at it. I am considering either buying a SDR2GO kit from K5BCQ which would make it a stand alone radio and more challenging, or the USB2SDR which looks overall easier, but still requires the PC. Both ways I can control the Si570.

Hank

Hi Hank

Perhaps we should change the title of this thread if we get further off-topic. No circuit needed - my aerial c/o relay is probably 60's vintage - from an old Pye utility mobile radio. Its a Magnetic Devices 12V relay - operates fine direct from Q5 collector pin - volts drop to 11 or so - which is OK for the input to the 8V regulator on the UHFSDR, and also the bias feed to my PA. I'll post a picture of it later in its 2oz tobacco tin with a stripline SWR bridge (currently bypassed to maximise my 70MHz o/p power).
These relays appear on eBay occasionally, but I am sure there are plenty of modern equivalents. You need one which will operate off 12V or less and can switch whatever power you PA produces. Presumably the relays used in the various higher power BPF boards are OK for this. The important thing about such a relay is that it has low capacitance at the off contact and doesn't introduce too much of an SWR glitch. In the case of the Magnetic Devices relay used at VHF, the coil operates an armature which connects to contacts on feedthroughs directly on the end of the relay. If you have more money, there are plenty of Coax relays available.

Tony

While you are discussing the rf switching and the common antenna
option can I ask another question?
I have almost finished my build but could not get the voltages
correct on U7 using the AS169 tests from the Assembly Guide dated
1st June 2012.
With H4 open (not shorted) I am supposed to see U7-6 as 0v and
U7-4 as 3.0-5.5v. Instead I have the reverse U7-6 is 4.8v and
U7-4 is 0v.
I was really worried by this and reflowed all the pins on U6 and
U7 - just the same result. So looking at the schematic I tried
shorting H4 for Sep. antenna. The readings are now back to where
they should be.
I don't really understand the action of U6 for Rf switching with
U7 so perhaps someone could tell me if this OK or what to try
please?
If it is OK then where do I pick up the sep.antenna?

Thanks Tony and Sid - the thread on U2/U7 strangeness was ....strange.
If I understand, using a jumper for H5-2/3 was correct and the AS169s is the right part. So I do have AS169s (labelled HMC554 on the packet). I broke U7 removing it because I thought it was bad. The new chip behaves the same as before with reversed polarity on pins6 and 4.
Hanks message from Dec 8 2011 had voltages for U6 which are the same as mine so there is hope :)
Hank also mentioned that 'some of the tests in the manual failed' so I shall just carry on and start the RX tests.
Thanks again for your help.
Chris

Hi Wolfgang,

I suggest you to have a look at USB2SDR
http://www.wb5rvz.com/usb2sdr/

I've do get excellent results with my UHFSDR as you can view in my files
http://groups.yahoo.com/group/UHFSDR/files/SV1IXP/

73 de SV1IXP

UHFSDR + USB2SDR + BPF/LPF + 100WPA HF/VHF/UHF

>
For AS169's definitely H5-2/3 strapped. As the build doc says, the
HMC544 is different to the CSH210R and AS169 so it's important to verify
which chip you have which I see you have done. I didn't know
mis-labelling is still happening.

The original documentation mentioned AS157 and that chip had me chasing
my tail for around 8 months - it is a dud as far as the UHFSDR is concerned.

As I was building I edited the build doc as a record for later reference.
---
193. If the HMC544 is installed, skip to step 214
CSH210R, ***AS157*** (Have 7), or AS169 Tests
*** AS169 *** (Have 10)
194. Connect H5-2 to H5-3.

I went through the same loop with U6 and U7 time and time again because
of the AS157. With CSH210R or AS169 you should be OK.

I case you need AS169's, I have spares.

Hi Kostas,
thanks for your hint and nice documentation. You answered an open question on USB2SDR to me .. if UHFSDR (i.e. the si570) is controlled by the board.
Gratulations for your project !
My intention is to build an exclusive IF-TRX for my microwave transverters, so we have something in common.
Just the ADC used in the SDR-Widget is far better than the one in the USB2SDR board, and it also runs with Linux, which i need as my "computer" will be a small RaspberryPI board (for the application in the field outside).
Your 2m and 70cm modules are inspiring to me anyway, as that could be a worthy add on to my microwave station.
So again thanks for your reply !!

Ok,

> Just the ADC used in the SDR-Widget is far better than the one in the USB2SDR board, and it also runs with Linux, which i need as my "computer" will be a small RaspberryPI board (for the application in the field outside).

For performance, with USB2SDR/UHFSDR the ADC gives me a total noise
figure better than my IC-910 !!
(-144dBm noise floor at 500Hz bandwidth) so it is well beyond my expectations already and of course there is 'HPADC' addon of USB2SDR with the ADC that
sdr-widget has, but I dont think I could gain anything more honestly.

As for Linux, from what I know there are some news on the field for
USB2SDR and gphsdr.
But for Tx, IMHO the only reliable, easy setup so far solution is the
PowerSDR and of course the Windows platform, thats why I chosen it.

1196. YU1LM 2-Meter BPF

Yahoo group: UHFSDR
Date: 2012-08-25 09:46:45 UTC
From: Oliver Goldenstein
Topic: 1196 Message: 1196

HI All !

Just finished a 2-Meter BPF designed by Tasa YU1LM.

I uploaded some pIctures to my UHFSDR Folder.

A description you may see here:

http://dl6kbg.blogspot.de/2012/08/2-meter-yu1lm-bandpass-filter-144-mhz.html

This Filter is not finished for ham-radio usage yet. But i think i will
keep this filter and will build a second one.

Have Fun !

From: rune
Topic: 1197 Message: 1197

Hello All

I have uploaded filter shape from my 100 watt filter today.(See under files LA7THA)
I am using a Signal Hound Spectrum Analyzer and tracking generator.
When i did my measure i found that the 24/28 Mhz filter and the 50 Mhz filter have "wrong" cutoff
I dont know if i have made the filter wrong or if this is actually a fault when i measure the filter. Any comments please.
The files are small pdf format

Rune:
Do you have the correct cores? If you have an inductance meter, check the coil inductance. The cores should be T50-10 cores and are black. They should not be Red or Yellow. It's possible I put the wrong ones in the kit.

Rune:
If the turns are close together, try spreading them out to use about
80% of the core. That will lower the inductance.

Hi Again Dave

Ok the never ending story to remember that 1 turn is counted when you pass the hole in the core. I removed 1 turn on the 50 Mhz filter, now 8 turn and the capacitors are checked to be the correct value C45 and C47 are 51 pF and C46 is 100 pF. After this I did the new test now I have around -5.4 db loss @ 50500 Mhz
Still the cutoff is not correct; I have also checked the core is type black. Was wondering if the test leads to and from the filter and generator was taken into account but from what I remember when you do a Sweep thru immediately you actually "reset" the Analyzer and generator or that will be you reference point. See in my folder LA7THA/new measurements. I do not have an inductance meter here onboard the ship, so I have to wait until I am coming back home in 3 weeks time.

Topic: 1196 Message: 1202

Hi Oliver,

I made up a YU1LM 144 Mhz filter and I spent many days trying to get it to work without success despite building it accurately to the information. I eventually used variables for ALL components and with the help of a vector network analyser I achieved the result show in my GM3SBC files section.

Insertion Loss 1.9dB 144 Mhz to 146 Mhz
122 Mhz -40 dB
167 Mhz -40 dB
Return loss 25dB within the passband , Flat response !

I think the chances of getting it to work correctly with standard parts is next to nil.

Regards Ed GM3SBC

Hi all!

Also in my setup I had to retune the filter by spreading out the coils so as to raise the passband's frequency (with Tasa's values it was centered in 135MHZ)
My final setup had 1.3dB insertion loss and less than 1.5 SWR in the 144-146MHz range. I did not change the capacitor values, I just spread out the coils checking the result with my miniVNA . You could also check this:

Hi !

I have uploaded a plot of yu1lm,s bandpass filter with under 1db loss under files/oz5agk . I also had to spread out the coils. The loss is not important at this point , I used a rx amplifire before the filter (Low noise 0,8 db) . I have also been playing with a 3/ helical filter and I best like yu1lm,s . Less loss and better curves .Maybe the pcb layout also is a factor.

Hi All !

Many thanks for all of your replies and suggestions. Mike i use a double sided copper.

Meanwhile i found this link which does a more precise calculation:

http://hamwaves.com/antennas/inductance.html

I prepared the second pcb board but will complete it tomorrow.

Based on the calculations from the provided link i now used a 4mm drill as a base for coil winding. So the center of the 1mm wire coil is at 5mm.

More updates tomorrow

Have a nice weekend

From: Flemming Nielsen
Topic: 1196 Message: 1209

Hi Mike.

I don´t think that thickness of copper is important but the thickness of the pcb may be a factor. Mine is 1,5 mm.How much of the surface is etched away is also important, it matters to
The capacity. What type of capacitors is also important. I prefers ceramic (on vhf and uhf) .If you can´t get a decent plot try to change your capacitors with other types of the same value (or adjustable, but use only high quality). I have bad experiences with film capacitors.

Was the same pcb material used? And thickness of copper? I'm thinking that might have made a difference...

Subject: SV: [UHFSDR] Re: YU1LM 2-Meter BPF

Hi !

I have uploaded a plot of yu1lm,s bandpass filter with under 1db loss under files/oz5agk . I also had to spread out the coils. The loss is not important at this point , I used a rx amplifire before the filter (Low noise 0,8 db) . I have also been playing with a 3/ helical filter and I best like yu1lm,s . Less loss and better curves .Maybe the pcb layout also is a factor.

Emne: Re: [UHFSDR] Re: YU1LM 2-Meter BPF

Hi all!

Also in my setup I had to retune the filter by spreading out the coils so as to raise the passband's frequency (with Tasa's values it was centered in 135MHZ)
My final setup had 1.3dB insertion loss and less than 1.5 SWR in the 144-146MHz range. I did not change the capacitor values, I just spread out the coils checking the result with my miniVNA . You could also check this:

Did you finally get it to work on WIN7 64 bit? Did you have a problem needing a signed driver? If it is working, I would like to upload the work around to the files area.

1211. Hardrock50 with UHFSDR

Yahoo group: UHFSDR
Date: 2012-09-11 21:55:49 UTC
From: joshtlogan
Topic: 1211 Message: 1211

I was curious if anyone had looked at combining the Hardrock50 with the UHFSDR.

http://www.hobbypcb.com/amateur-radio/amateur-radio/hardrock-50-hf-power-amp-kit.html

Any suggestions?

73, Josh KD7HGL

Jim had this response:

Buying another driver board might be a low cost way to go and it should be possible to cascade them. If you only need 1/2 watt it doesn't make sense to use a 4:1 transformer on the output. I attached a schematic for 1W, 22 dB gain amp that I use on my bench to get the Siggen up to the 1/2 watt needed to test amplifiers. I built it in a small Bud bow with a BNC on each end. It biases at about 100mA

You could get a driver PCB and build this circuit on it and put it inside the Hardrock-50 with the stock driver. The only thing I would be concerned about is oscillation, you are starting to get lots of gain in a relatively small enclosure. But if you pays careful attention to shielded coax runs it should be OK.

73's
Jim WA2EUJ

I think it would be possible to get a bit more gain in place. What I did not understand was the RX/TX chain and if relays would be in the right place for it to work.

Do you have other suggestions for a TX power chain?

There is plenty of room in the Hardrock50 enclosure for the UHFSDR board. All we need is a small SMD low pass filter 1.8 - 54 MHz, additional software on the control PCB and it could be possible to have a self contained 50W SDR Transceiver.

Hi Mike,
I thought that little pre-driver was what you were looking for. I left off one of the zeros at the end.
It is 500mw not .50mw drive as you said....
Sorry.....

Topic: 1211 Message: 1221

ok .. figured that was what was going on ...

I asked if the designer would install a RD06hhf and drive to 3db saturation .....
wasn't interested in doin it ... thats ok .

After about ten minutes of power-on, I start hearing snap, krackle, and pop noise in the audio.

Using a scope, I traced it to the output of Q1/input to U10A. It appears that one of these devices becomes noisy after it warms up; I suspect Q1, a MMBT4401 transistor. I have some on order.

Has anyone else experienced this; if so what did you find the problem to be?

1228. Raspberry PI

Yahoo group: UHFSDR
Date: 2012-09-15 20:34:00 UTC
From: brainerdd
Topic: 1228 Message: 1228

I just ordered a $35 Raspberry PI from Newark. It has been shipped.
The more I investigate it, the more impressed I am. I have the following in mind(my need more then 1)
RMS Winlink Gateway
Echo LInk/IRLP Link

The most ambitious idea is for a back end to the UHFSDR. The auxillary socket on the PI has I2C and GPIO pins plus high level command support for both is available for Python(I will have to learn that, but looks very similar to C). There is an example of it driving a 16 X 2 LCD panel using some of the GPIO pins. It will also need a USB soundcard as the board has no audio input. Now I need some light weight Linux SDR programs.

Dave,

I picked up 2 of them. I have one hooked up as a media server to my television running OpenElec/XMBC. The other is on my bench next to my UHFSDR. Let me know how it goes for you. I think a 7 to 10" touch screen would be an excellent front end for this but your LCD idea would be much cheaper. For its size and price it is remarkably fast running as a media server. Unfortunatley I think the USB is only 2.0, but the neat thing is you can actually power the Pi from the USB port. For the radio, if it only has to handle the frequencyj control, band switching, and display with an off board DAC for audio it might work. More than that I am not sure.

1230. Re: [UHFSDR] Re: Raspberry PI

Yahoo group: UHFSDR
Date: 2012-09-16 00:20:35 UTC
From: Sid Boyce
Topic: 1228 Message: 1230

I power my Raspberry Pi from a 3A P.S adjusted for 4.97V measured on board the Pi.
It's recommended not to run it from a USB port on a PC which may not deliver the 700mA required or near +5V. I can't find the page at present but I've seen it on the Raspberry Pi forum I am subscribed to.

The Rev 1 board has 2 polyfuses which have been shorted out with 0 ohm resistors on the Rev 2 boards, that's an attempt to make the USB stable.

I have shorted out polyfuses F1 and F2 on my Rev 1 board.

If I overclock to 855 MHz it freezes anywhere from immediately to several hours so I have only been able to run mine without freezing at 700MHz.

USB support is poor even at 700MHz.

Mine freezes with 5 devices connected - a Keyboard, Mouse, SB Live! 24 USB sound card, Gigabit Ethernet dongle and a RTL-SDR TV dongle on a powered USB hub of the same type that Maplin UK supplies with their Raspberry Pi bundle. Theirs is the 4-port and mine is the 7-port.

Removing the RTL-SDR dongle has made it stable.

Sound is still a problem which probably is associated with pulseaudio. When playing a wav file, pulseaudio does not show either card with the "m" (writeable) flag set.

Guys have recommended the XBMC distribution but I need pulseaudio for SDR programs such as QtRadio from the ghpsdr3-alex project.

```
root@pisces:/usr/share/sounds/alsa# aplay -dhw:1 Noise.wav
Playing WAVE 'Noise.wav' : Signed 16 bit Little Endian, Rate 48000 Hz, Mono
root@pisces:/usr/share/sounds/alsa# fuser -v /dev/snd/*
USER PID ACCESS COMMAND
/dev/snd/controlC0: lancelot 2702 F.... pulseaudio
/dev/snd/controlC1: lancelot 2702 F.... pulseaudio
/dev/snd/pcmC0D0p: lancelot 2702 F.... pulseaudio
/dev/snd/timer: lancelot 2702 f.... pulseaudio
```

None of the devices emit sound, alsamixer has the volume set to 100%.

```
sudo amixer cset numid=3
```

Substituting <n> for the desired mode: 0=auto, 1=headphones, 2=hdmi. For example, to force the Raspberry Pi to use the analog output:

```
sudo amixer cset numid=3 1
```

Leif has released Linrad 03.44 which is supposed to work but I
haven't tried it yet.

At one stage I had sound in QtRadio working after a fashion, no
sound as it was running but when I clicked Disconnect and the
waterfall and spectrum stopped, perfect HMDI sound came from it
until the disconnect finally happened.

I think that was with the debian wheezy distro, I'm now running the
raspbian pisces distro which is a version of debian.

http://napan.ca/ghpsdr3/index.php/QtRadio_Installation#Installing_ghpsdr3-alex_on_Raspberry_Pi

Sid,

Your right, a dedicated power supply is probably always better. Links on power here.

http://elinux.org/RPi_Hardware_Basic_Setup#Power_Supply

and

http://elinux.org/Rpi_Hardware#Power

If you get the required 5V at correct current the USB should be fine as in the case of by Samsung TV that powers one of the Pi's for the media center. The XMBC as a media center is interesting as you can control the application running on the Pi via the Tv remote. Now the the 46" samsung would be a hell of an Panadapter display! If you could get the audio out through the HMDI port that would be interesting.

The other Pi that I am comtemplating with the UHFSDR is on a 5V wall wart on my radio bench.

Thanks for the links to the QtRadio on the Pi. Interesting reading as I had not seen that yet. You are way further along with your Pi than I am. Keep the good information coming.

Thanks,

Hank

Hi Mike,
I had the servers running OK but now I'm testing the HiQSDR at 960Ksps
which the Pi can't handle.

With a 3A P.S it's still limited me to 4 devices connected to a powered
USB hub and I have the polyfuses shorted out.

Sid,

I am confused. I am referring to powering the Pi through its USB and not the opposite of powering external USB devices from the Pi's USB connection. Obviously that might drae too much current from the Pi. Are we referring to the same thing? I just thought it was interesting that I could use the USB out on my TV to power the Pi. This feature might be handy and eliminate the need for a seperate psi just for the Pi when integrating everything into a common box.

From: MIKE DURKIN
Topic: 1228 Message: 1236

I plan on using a bunch of lm7805's on a 12v source ...

One for the RaspI, two for the hub ....

Three to get ready .....

Oh ... that's a different thought.

From: Sid Boyce
Topic: 1228 Message: 1237

Powering the Raspberry Pi from a USB port or hub is not recommended as the voltage reaching the Pi is hardly likely to be near +5V @ 700mA because of the drop in the thin USB cable.

The power getting to the Pi has an impact on the USB subsystem irrespective of whether there is a powered hub with the external devices connected to it.

From what I have experienced, +5.17V at the Pi and using a powered hub only a maximum of 4 devices can be connected, adding a 5th. causes the Pi to hang. That is with polyfuses F1 and F2 shorted out.
73 ... SId.

Hi Mike,
The first hub I tried was supplied from a +5V P.S delivering +5.15V @ 5A
shared with the Pandaboard.

The second hub I am using has it's own +5V 2A supply - +5.16V measured
at the hub.

I can try with the hub connected to a +5V 3A supply.
73 ... Sid.

1240. Add on to UHFSDR

Yahoo group: UHFSDR
Date: 2012-09-25 17:32:33 UTC
From: MIKE DURKIN
Topic: 1240 Message: 1240

Hello all ...

Im wondering how much more power can be drawn from the UHFSDR from the 5v and 3v regulators ....
Im thinking of the possibility of adding a UBW32 like minimum populated board .... for Si570 control and BPF control .... of the BPF filter Dave offers ....

Mike KC7NOA

1241. Re: [UHFSDR] Add on to UHFSDR

Mike:
The 7805 is rated for 1 Amp and the 3.3V regulator is rated for 250 ma. Don't remember what the whole board takes. The Si570 takes about 100mA at 3.3V.

I will be manning one of the road closure barricades for one of the large fires we have around here for the next 2 weeks. Couldn't pass up the offer of $30/hour with 12 hour shifts for 2 weeks! I will not have internet and probably no cell phone coverage(will have Ham Radio!). I will also not be able to ship orders while away.

I found the 7805 was running very hot so I moved it off board.

At first I used the 7805 on a largish heatsink with a CPU fan.

I am using a LM338 5A adjustable regulator on a largish heatsink I had
but a CPU heatsink would have done the job. I backed it up with a CPU
fan regulated by a LM317T for silent running.

With 5A it powers the UHFSDR + SDR-Widget and gives room for add-ons.
+13.8V --> LM338 --> UHFSDR/WIdget.

The LM338 circuit is straight off the datasheet.

BTW the UBW16 and later the UBW32 was initially run from the on-board 7805.

I have some pic32mc564h on a 1" pcb with headers all around. I was trying to see what us the true minimum parts needed to use Alex Lee version of PE0FKO 's firmware .... but he used a UBW32 .. at 40$.

Since the UHFSDR has 3.3v & 5v already .... and you don't really need all the switches and headers that comes on a UBW32... get my thinking ...

I got the pcb for 2$ and the pic32's for 5$ each ... need two deferent clocks and some caps that I know for sure...

You have to be a member of either the Idaho County Search and Rescue
or the Sheriff Possie. We provide communications for the search and
rescue, so became members for the protections the county could provide.
Probably because they have already done background checks and we have
Sheriff dept. ID's. Will get paid by the Forestry dept. Should pay for
our planned 2014 trip and booth at Dayton!

Mike

SDR# shows a rough estimation of phase and amplitude imbalance in the title bar when Youssef's automatic IQ correction algorithm is enabled. It makes the assumption the error is not frequency dependant. This is mostly OK.

I guess you are looking for something more to make some firm measurements.

It takes a little time for the algorithm to converge since it is essentially brute forcing the imbalance away.

Recently the algorithm was modified to only activate on the detection of a useful carrier above a certain threshold.

Yes. It is the SPF5043Z MMIC low noise preamp. I sell the chip alone for $6 to US and $7 for DX.

1263. UHFSDR Construction Experience

Yahoo group: UHFSDR
Date: 2012-10-15 03:41:47 UTC
From: keestheham
Topic: 1263 Message: 1263

Finally had some time and put my first UHFSDR together.

Great little kit. I haven't powered it up yet but it's built and went together smoothly.

I only have 4 minor comments:

1)Instruction 157 says Install TI. It really should say install T1 (WBC2-1TL). The other little RF transformer (TC1-1-13M+) is for clock input isolation (as is the second SMA connector).

2)The dot for T1 is in the wrong place on the board. The little thing has 6 terminals and there are 6 pads ....but the center tap on the RF transformer needs to be toward the mixers where it picks up a ground. That puts the red dot towards the bottom.

3)D1 is one tiny diode and it is marked with a Cathode "bar", be sure and orient it correctly.

4)It works better to solder C10 before you mount the SMA connector and don't seat it all the way so it does not interfere with C10.

One other change I made was to remove the +5V regulator and power the board from a separate power supply 13.8V --> LM338 5A adjustable regulator mounted on a heatsink about the size of the one used for the K5BCQ 20W PA with an exhaust fan mounted on the heatsink.

Mike, Here are the steps and results for the upgrade. Nothing else is needed.73,Alan – W6ARH From: UHFSDR@yahoogroups.com [mailto:UHFSDR@yahoogroups.com] On Behalf Of Ed
Sent: Wednesday, February 22, 2012 1:15 PM
To: UHFSDR@yahoogroups.com
Subject: [UHFSDR] UHFSDR Sensitivity Improvement Hello All you UHFSDR lovers,

I decided to do some further measurements of the MDS on my UHFSDR.

I started by measuring the UHFSDR unmodified in the following set up conditions:

Software: WRplus
PC: ASPIRE One Net book
Signal Generator: HP with additional Microwave attenuators.
Mode : CW
Frequency: 144.300 Mhz
Bandwidth: 500Hz
AGC:Off

The result for 1 dB signal above noise power : -133dBm.

I then decided to change U4 (BGA612) to a different type of MMIC, the SPF5043Z. This is a 50 Mhz to 4 Ghz part with high dynamic range. It has a lower noise figure and higher gain than the BGA612.

The mod was simple, remove the BGA612, install the SPF5043Z taking care to check the different orientation and replace R3 (120 ohm)with a 100nH Inductor.

The result for 1 dB signal above noise power : -145dBm

So if you want a super sensitive VHF/UHF front end, you got it !

Only possible down side is that the IC starts to degrade below 50 Mhz. It could still be adequate for the DC bands if you really must use the UHFSDR for that purpose.

What a remarkable little radio this is.

Regards

Ed GM3SBC

Hi there

I am thinking about getting and having a go at constructing a UHFSDR. But I have a few questions to ask before I start:

Does it receive and transmit anywhere between 1.75-700MHz or does it only do the amateur bands?

I have a 192KHz 24bit sound card, would it transmit and receive the whole 192KHz (+/- 96KHz of the center frequency)?

It Rx/tx just slightly below the 160m band ... up to one half of the max the si570 that you get. There are gaps in the coverage .. their easiest to guess by looking at the coverage the Si570 you get ... then devide by two ...

The Si570 clsssis "A" is speced to "10 to 945MHz, 970 to 1134MHz, and 1213 to 1417.5MHz"

The gaps should occur at 472.5mhz to 485mhz AND 567Mhz to 606.5Mhz .... but everyone already knows the bottom end is not 10Mhz but around 3.5Mhz ... for a useful bottom end around of1 ~1.75Mhz Rx/Tx ...

Soo iv never tested the "Actual" gaps ...

Peter:
The UHFSDR will transmit and receive over the entire range. There are some holes in the 550 to 700 MHz range due to the Si570(the UHFSDR operaters at 1/2 of the Si570 frequency). With a 192 KHz sound card you will see 192 KHz at once. You will need to add BPF filters for the receive to eliminate harmonic and sub-harmonic responses and LPF on the transmit to reduce odd harmonics.

AND ... if you have a really good soundcard ...

Add another 80khz of usage to each gap(for a 192khz soundsource)

472.5mhz to 485mhz = 473.3Mhz (positive offset) to 484.2Mhz (negative offset)

AND 567Mhz to 606.5Mhz = 567.8Mhz to 605.7Mhz

Topic: 1278 Message: 1278

Hi All,

Sorry if this is too far off topic.

I am trying to install GNU Radio on a computer running PCLinuxOS.

After sorting out all the dependancies. Why isn't the list either in alpha order or grouped? It is a nightmare to sort out.

Now it uses cmake. I tried the commandline version and it just doesn't accept anything. Nothing unusual there. I have NEVER gotten anything to install with cmake. Tried the cmake gui version and after finding out it doesn't have ninja tried Unix and it seems to configure and generate without ending in an error.

What next? Trying cmake install from commandline gets nowhere. The gui has no other steps/information.

What is the actual program called once installed? Where does it get installed as it didn't ask for root password.

Cheers
Will

Hi Will.
I have built gnuradio a number of times with a patch for the HiQSDR.
Latest git built was 8th. October on openSUSE 12.3.

"cmake ." or from the build directory "cmake .." prints what it can't find.
If you use "ccmake ." or "ccmake .." from the build directory you can
see what's NOT FOUND when you use (c) to configure gnuradio.

I'm trying to make it simple for you I hope.

If you run "cmake ." it gives a summary of what the Makefile will build.
If there is something you need built, you have to look at the output of
cmake to see what is missing and install it, usually they are missing
-dev packages.

Admittedly cmake is not as easy to deal with as ./configure, it may make
life easier for the authors but quite hard going for builders of the
software.
73 ... Sid.

```
An example from a new git clone.
# git clone git://gnuradio.org/gnuradio
# cd gnuradio
# mkdir build
# cd build

When you do "cmake .." you can go through the output to see if there is
anything needed that has not been found and supply it.

If you need to alter paths, e.g from /usr/local to /usr, "ccmake .."
alter the line, (c)onfigure, (g)enerate and when it's done, "cmake ..",
"make", "make install".
I have an 8-core box so I use "make -j 8" and "make -j 8 install".

gnuradio/build # cmake ..

1281. BPF kit availability

Yahoo group: UHFSDR
Date: 2012-10-22 17:32:52 UTC
From: keestheham
Topic: 1281 Message: 1281

I've been working with Dave to put a complete kit together using his BPF board with Chip Inductors or "you wind 'em" Toroid Inductors ....with or without the board just in case you already purchased the board. Details are at http://www.qsl.net/k5bcq/Kits/Kits.html

These BPFs are intended for receive inputs and will work with many radios including I/Q radios like UHFSDR and SoftRocks. Band selection is via 3 bits which can be driven by logic levels (Si570 Controller, SDR2GO, etc) or a Octal switch (8 positions used) to ground since they have pull-ups.

One possibility I need to look into is using the 8574 I/O board as used
with the Mobo v4.3.4 to do the BPF switching.

1283. need part

Yahoo group: UHFSDR
Date: 2012-10-31 16:46:37 UTC
From: MIKE DURKIN
Topic: 1283 Message: 1283

Well my first UHFSDR board and started making popping noise again ... and since my Scope was back in working order ... traced my problem down to the MC33078. So I need another one ...

If any one gas one for sale, please let me know ... I also am interested in a pair of 100nF inductors for the Rx upgrade ...

Mike KC7NOA

In that space it looks like 0603 would do. I managed to fit one that's the size of a regular through hole 1/2W resistor.

Alan, if you are getting them I would like to have 2 from you and also 2 FST3257's.

I got some SN74CBT3257's from RS Somponents, resulting in ~60dBm noise floor and also no signals.

I'll Paypal as usual.

That is L1 and the pads will accept either 0805 or 1210 or 1206. You could probably put a 0603 in there as well. If you are going to go below about 10 MHz, 100 nH is too small. Use 1uH or higher(my latest schematic shows 3.3 uH). If you are going to use both UHF and below 10 MHz, make sure the SRF of the coil is near or above your highest freq.

Alan:
What are you buying for the current kits? The new mmic should be
able to use the same inductor. The one I have on my schematic is the
IMC1210ER3R3K, available from Mouser for $0.47. Its SRF is 60 MHz, so
don't know how well it would work at 450 MHz.

Subject: [UHFSDR] need part

Well my
first UHFSDR board and started
making popping noise again ...
and since my Scope was back in
working order ... traced my
problem down to the MC33078. So
I need another one ...

If any one gas one for
sale, please let me know ... I
also am interested in a pair of
100nF inductors for the Rx
upgrade ...

ok, so where are we on this??

Replace R3 with a 100nH inductor? since the top end looks about 700Mhz i guess that small isnt needed ...
Im still interested in that MC33078 --

I ordered 100 nH 0805 inductors which I should receive mid-week. I can sell you both chips but the shipment cost almost equals the cost of the chips. It looks like $3.50 will cover it.

In the Photos section, I have uploaded a few pictures of my IF Radio transceiver that uses the UHFSDR and SDR2GO boards.

The transceiver acts as the IF Radio for my 33cm and 23cm transverters, and also is a transceiver for the 222 MHz and 432 MHz bands.

This is a 'stand alone' radio (no computer required), using the SDR2GO board developed by members of the Austin QRP club.

More pictures to follow. . . . .

Johannes,
Yes. I am packaging AS169s as a substitute for the HMC554s. I am not aware of any pin out changes resulting from that substitution. In the BOM there are four choices for the chip and I was unable to get HMC554s. The identification template has not been updated hence the possible confusion.
If your experience is true it will be helpful to others. Your report is the first I've heard of a problem with the inventory.
73,
Alan - W6ARH

Hi Alan,

has taken a few months until I had the time to build the UHFSDR, and I don't know if this Info is going to be helpful for you or if you already know: I'm currently at step ~200 and has a device marked "U2,
U7 HMC554 (2)". I thought that was a typo and proceeded as with the HMC544. However, after builining it, it failed tests (inverted output). Now looking closely (should have done it before...), the component marking says S169, so I'm very much guessing you packed some AS169 in a HMC544 pacakge. Just saying because maybe others are confused by the mixup.

Are there maybe other errata or is there a site that I can check to see user build experiences?

Thanks again for the great kit, really excited to see what it can do, Best regards,
Johannes

From: Heinrich Schnorltz
Topic: 1303 Message: 1304

Hi Alan,

first, sorry for responding from a different account -- I can only post to the list from within Yahoo (and am registeredered here).

I should have looked more closely at the chip. But anyways, I've run into some other trouble (and this is also why I'm posting to the list, I don't want to bother you exclusively but maybe someone else also knows the solution).

So I've completed everything until step 195 and am using the AS169. H5-2/H5-3 are shorted. When I do the testing, U2 works as expected (i.e. 197, 198, 201, 202 OK), but the U7 is inverted. That is, in 199/200 there is Low/High the expected result, but I get High/Low. When applying 5V to P2-1, it switches (but is again wrong).

Looking at the schematic I'm a bit puzzled, so maybe someone could help me here: Since U2 is working as expected, T=High and R=Low. TA is expected to be Low (but is High in my case). TA is the output of U6B. It receives Low on 4 and High on 5. I'm guessing the High on 5 is expected (the line is marked +5VF, I'm guessing this is an implicit connection with identical netnames), which would mean pin 4 of the 7400 would need to be Low to get the desired result (pin 6 Low). But since pin 2 of the 7400 is also High (over H5-2/H5-3 and R64 to +5VF), this would mean pin 1 of the 7400 would need to be Low. This is only the case when I short H4 (but this is not part of the instructions, which I left it open). The pullup R58 thus causes pin 1 of the 7400 to be High.

I'm guessing I'm missing something very trivial here. Could somebody maybe enlighten me on what I'm doing wrong?

Thanks in advance,
Best regards,
Johannes

Johannes,
Yes. I am packaging AS169s as a substitute for the HMC554s. I am not aware of any pin out changes resulting from that substitution. In the BOM there are four choices for the chip and I was unable to get HMC554s. The identification template has not been updated hence the possible confusion.
If your experience is true it will be helpful to others. Your report is the first I've heard of a problem with the inventory.

Whatever you do, steer well clear of AS157's if they are still listed.

I suspect the pinout was just a copy of the AS169's and they will run
you ragged as no strapping of H5 will get you both RX and TX.

After many months of chasing my tail around the circuit with 2 UHFSDR's
I changed to AS169's and everything then worked as it should.

I have had mine running with hiqsdr-server, dspserver and QtRadio for
some weeks now.

Today I built an updated kernel for it and it's up and running.

The reason I needed a new kernel - the kernel in the downloaded image
has a kernel that doesn't support USB sound cards and the sources are
not available to allow building the required module so I decided to roll
my own based on an up-level Linaro git source.
The build was the same as for a x86/x86_64 kernel.
The linux-headers, linux-image and uImage are on
https://sites.google.com/site/sidboyceg3vbv/tasks

I hooked up a 64GB USB HD to give me enough space for the kernel sources
and the build just progressed as normal.
Having 4 CPU cores, it can take on big compile jobs.

There seems to be a way to boot off a HD, rather boot would initiate on
the SD card and hand over to the HD. I need to digest the full procedure
before I try it.

Hi Mike,
I haven't checked what the max samplerate is spec'd at for the on-board sound as the HiQSDR only needs a sound card for Mic/SPKR.

Any tests I do will most likely be with the E-MU 0404 USB used for I-Q where it will do 192K samplerate or UHFSDR+SDR-Widget. I'll see if the ODROID-X will handle that amount of USB traffic.

There is a sound driver for the on-board sound in the supplied image but
none for USB sound.

I used the Linaro 3.6.6 kernel git source and configured USB sound.
root@ODROID-X_G3VBV:/# cat /proc/asound/cards
0 [hkdkmax98090]: hkdk-max98090 - hkdk-max98090
hkdk-max98090
1 [USB]: USB-Audio - E-MU 0404 | USB
E-MU Systems, Inc. E-MU 0404 | USB at
usb-s5p-ehci-2.1.3.3, high speed

My kernel deb packages are at
https://sites.google.com/site/sidboyceg3vbv/tasks

I built the kernel on the ODROID-X so the files can be installed with
"dpkg -i".

There is also a uImage file that has to go on to partition 2 so it will
boot the 3.6.6 kernel but it can't be done on the ODROID-X.

To do this, copy the uImage file over to the PC.

Power down the ODROID-X, insert the card in a reader on the PC, dmesg
will tell you what it's called, e.g /dev/sda2 (The FAT partition).
Check with "df" to see if it's automounted, if it's not mount it by
making a directory say, /tmp/x and mounting it there.

The uImage file that's there, rename to uImage_old and copy the new
uImage file to that directory.
Issue a couple of sync commands and umount it.

It's now ready for booting up the ODROID-X with the 3.6.6 kernel.
root@ODROID-X_G3VBV:~# uname -r
3.6.6
73 ... Sid.

1321. Flip Flops don't toggle reliably at 444 MHz

Yahoo group: UHFSDR
Date: 2012-11-19 23:09:41 UTC
From: rhillard@austin.rr.com
Topic: 1321 Message: 1321

I'm in the process of adding the 222 MHz band to my transceiver, and I find that the flip flops on the UHFSDR are not toggling reliably at this frequency (444MHz).

There is a 6dB difference in RF output of my Si570 at 444 MHz and at 864 MHz (the clock freq for the 432 MHz band), with 444 MHz having the lower RF level of the two. The flip flops toggle fine at 864 and 932 MHz.

I'm using a LVPECL Si570 as the clock rather than a LVDS device. It's interesting that the output response of the two chip types is quite different, with my LVPECL device sloping up as it goes from a low frequency to a high frequency, and my LVDS sloping down from low to high frequency.

As Murphy would have it, the output of my LVPECL Si570 is 6dB lower than it is at 864 and 932 MHz, and the flip flops appear to not like that.

As the chips warm up the flip flops start toggling at 444 MHz, but its not completely reliable.

Could I change the values of the the two voltage dividers (R46/R47 and R48/R49) located between the Si570 and the flip flops to give me some additional RF level at the input to the flip flops? It probably wouldn't take much additional RF to make the flip flops happier.

Bob WA6UFQ

1322. Re: [UHFSDR] Flip Flops don't toggle reliably at 444 MHz

Bob:
You could try that. Watch the DC level. I have not checked the
Si570 LVPECL levels vs freq. You do have the voltage dividor values
for the LVPECL rather than for the LVDS(they are different). I haven't
tried my at 222. But, it works fine at 2M , at HF, and on 440 MHz.

From: rhillard@austin.rr.com
Topic: 1321 Message: 1323

Hi Dave,

Thanks for the quick reply.

I'm currently using a LVPECL device, and the component values for the voltage dividers, as well as the rest of the setup feeding the voltage dividers are as recommended for a LVPECL Si570.

Would you recommend keeping the voltage divider's total resistance the same as for the LVPECL (82 + 130 = 212 ohms) but try different ratios such as 53 + 159 = 212 ohms, or should I keep the resistance ratio constant while increasing the total resistance of the voltage dividers, or maybe some conbination of the two approaches?

1325. Re: Flip Flops don't toggle reliably at 444 MHz

Yahoo group: UHFSDR
Date: 2012-11-20 20:56:07 UTC
From: rhillard@austin.rr.com
Topic: 1321 Message: 1325

Dave,

FIXED IT!

Checking my inventory of 805 resistors, I found pairs of resistors that were approximately four times the value of the original resistors.

This combination of resistors in each voltage divider maintains the nominal 3 volts DC at the input to the flip flops while decreasing the load that the LVPECL Si570 looks into by a factor of four. The resulting increase in level to the flip flops were apparently sufficient to make The flip flops happy at this frequency.

The resistor values that I used were 348 ohms for R46 and R48, and 510 ohms for R47 and R49.

Hi dear all!
I'm new to the group, so excuse me for my questions.
A friend of mine has lost his CD with the software attached to the project, so I wonder where I can find one or wich drivers and programs I need to run & and control the UHFSDR?
Thanks in advance,
Serge, RW3ACQ

Ok ... good luck.

The UHFSDR has no controller on board ... there are a few options to chose from with a wide range of options - depending on how much money you want to spend ...

Hello, dear Mike!
After exchanging a couple of e-mails with the UHFSDR owner who actually needs these drivers, I've got the following: Windows XP, Control via USB. Could it be enough to find the appropriate software?
He's sure that something went wrong with the "drivers".
Thank you!

To: Alan Hill
Subject: Re: UHFSDR kit

Hi Alan,

my UHFSDR was working fine till today, but I might need your support now.

Unfortunately today I connected the wrong cable to the UHFSDR Ant input. I
was transmitting with my other TRX with 5 watts (on 20 m) connected to
UHFSDR input during rx and now there are about 20 dB sensitivity missing.

Which components might be "burned" and have to be replaced?

Yahoo group: UHFSDR
Date: 2012-12-07 15:29:04 UTC
From: g.suggate
Topic: 714 Message: 1339

Hello All,

I have recently returned to work on my UHFSDR, and in a bid to improve sensitivity fitted the SPF5043 MMIC chip to replace the BGA212. The 120 ohm resistor was relaced by a 150nH inductor. Whilst it does work the circuit is now intermittently unstable. Sounds almost like the "microphony" of times past.
Has anybody else experienced this and devised a fix ??

I would go back to the BGA212 but it disappeared !

Seasons Greetings

Geoff G3NPI Buckingham UK

1340. Noise Spikes

Yahoo group: UHFSDR
Date: 2012-12-10 17:17:29 UTC
From: tony_g3ovh
Topic: 1340 Message: 1340

This message started off as a request for help, but at the end I found the solution, so I am still sending it in case others have similar problems:

I am using a UHFSDR with the audio to a SoundBlaster Live 16bit USB, and a QRP2000 USB controller for the Si570. It's all controlled with PowerSDR-IQ running on an old PC - a Medion Pentium 4 2.6GHz running windows XP. The QRP2000 is in the same diecast box as the UHFSDR, but fairly well removed from the audio amps and RF input. My problem was that around the centre spike of the spectrum I get spikes at exactly 1kHz intervals, out to a distance of +/- 10 kHz. The two nearest the centreline are -110dB and they tail away to the noise floor at -140dB. If I disconnect the USB cable feeding the QRP2000 the spikes are still present but 10dB lower. Disconnecting the QRP2000 from the UHFSDR ADUM1251 makes no difference. I can sometimes see them by touching the audio input to the Soundblaster card, and turning off the UHFSDR 12V supply makes little difference.

Solution - found that disconnecting the line input to the SoundBlaster card from the UHFSDR and connecting to any ground forming a ground loop picked up the spikes worse, so they weren't coming from the UHFSDR.
Eventually, found that putting 6 turns of the USB lead feeding the Soundblaster Live unit through a toroidal core cured most of the problem. Small cores threaded on the lead did nothing, but the core of a toroidal mains transformer worked well. In the end I used the ferrite core of an old line output transformer. The interference was reduced to just two spikes at 1kHz from the centre line at -120dB. I presume that the switched mode PSU in the PC was the culprit.

1342. New super UHFSDR

Yahoo group: UHFSDR
Date: 2012-12-17 06:01:21 UTC
From: brainerdd
Topic: 1342 Message: 1342

I am looking at developing a new transceiver based on the UHFSDR. I envision 2 receiver strips and one transmitter strip. That would allow cross-banding as in the FT-8800(with VHF or UHF to HF also). Separate strips would cut out some of the transmit/receive switching and could allow duplex operation(with sufficient freq. separation and filtering).
I have been looking at controller chips. The ATMEL ATSAM3UXX looks really good and is cheap(well under $10 qty 1 and under 5 at qty 25) from Mouser and Digikey. They are based on the ARM M3 and have 64K, 128K, or 256K Bytes of Flash program memory, 20K to 52K Bytes of RAM, a High Speed USB interface, I2C, I2S, timers, etc, plus a bootloader in ROM. Some DSP instructions are included as well. Only bad is only in 100 or 144 pin TQFP or TQBGA packages. The TQFP's are doable by hand(.5mm pin spacing).
Does anyone have any experience with them. Would it be possible to hang one or 2 stereo A/D's onto the I2S bus and decode SSB, CW, and NFM plus data modes? I think it should have enough horsepower to do that over a narrow band without the waterfall.
The receiver strips would include a set of selectable BPF's(similar to my small BPF board). The transmit strip would have enough output to drive a 100W amp. My MPLPF board would be used for the transmit LPF.
I also found 2.6" and 3.5" touch screen TFT LCD displays (240 X 320) for $8 and $15!

Alan:
I have been thinking on this for quite a while. The goal is a complete self-contained(with provision to connector to PC and use SDR programs) 100W transceiver covering 160 meters to 70 cm and possibly 1296 MHz. I would like to have things going in time to have a booth at Dayton in 2014.

From: marc olanié
Topic: 1342 Message: 1345

I know what my future rig will be :-))

Il already have two UHFSDR running with George's SDR Widget, and was considering mixing the two SDR to add duplex and crossband capabilities, with a devilish bunch or relays, switches and wiring :-(Glad to hear that you will realize my dream. I won't have to fight with such a messy wiring

The SDR Widget also has a 144 TQFP. Soldering it is definitely not an issue, even for a non-technical-low-level ham like me. And I'm pretty sure that OM's of goodwill will help those who are not confident in their soldering skill. This should not be an obstacle in your engineering work.

I long for the next Dayton :-)

Marc f6itu

PS : Adding the 23 cm band is definitely a "must have". I've tried to add an old KK7B "no tune transverter" behind the UHFSDR, but the results have been mixed, almost disappointing

Dave,

You could look at the Ti Stellaris Launchpad development board. They are $12.99 delivered and have an ARM Cortex M4F core. Full details are here :-

http://www.ti.com/tool/ek-lm4f120xl?DCMP=D_MCU_Stellaris_Stellaris&CMP=KNC-GoogleTI&247SEM

One thing about them that is not widely known is that you can program these with an Arduino "Fork" called Energia. Details here :-

https://github.com/energia/Energia/wiki/Getting-Started

So a lot of Arduino code and libraries will work without modification apart from changing I/O pins. The other advantage is it's not difficult to use and is free.

For those of you wanting something simpler, and cheaper, they do a Launchpad board for the 16 bit MSP430 range complete with a spare processor, a USB cable and a clock crystal for under $5 delivered.

At the moment I am playing with the MSP430 to control an El-Cheapo EBay AD9850 DDS for QRSS use along with my good friend Guido PE1NZZ.

73s from England,

Steve G0XAR

Have you decided what software you're going to use for the SDR?

On Linux and my Mac, I run "dttsp", which is the signal processing core from PowerSDR. On Windows it's a DLL but on linux it runs as an independent process. I recall reading that dttsp could be run on a 500mhz processor (probably a pentium or so). I've been using it on my 2ghz Atom system, and basic receive takes about 10% of the CPU for one audio signal. When I turn on the noise reduction, it goes to 40% or so. I'm hoping it will run on a Raspberry Pi.

The SDR Widget project used an I2S interface to a conventional audio chip. Schematics and software for it are available, and might be of some use to you. That project was succeeded by the Audio Widget, but I haven't found it's schematics.

I hope you'll share your filter designs for VHF and UHF, as filters for 50/144/222/432 are the main thing I find missing from the UHFSDR.

Mike:
Looks like the two are fairly close. The PIC is an M4 running at 80 MHz with 1.55 DMIPS/ MHz = 124 MDMips. The SAM3U is an M3 running at 96 MHz with 1.25 DMIPS/MHz = 120 MDMips.

I don't know yet for the firmware for the stand alone operation. As for computer operation, any of the SDR packages that work on Softrocks should work. The favorite is SDR-IQ. I have a Raspberry PI and am looking at possibly using it for the DSP.

I bought 5 off of ebay for 5$ each .... I tried to flash one with a bootloader .... with no life - but I didn't use an external 3.3v regulator at the time of flash ... I forced the pickit3 to provide source power.... later I read lots if people had problems doing that, solved with an on board regulator. Iv placed a 3.3v on the board but haven't tried again .... all might be clone junk for all I know.

Mike:

Looks like the two are fairly close. The PIC is an M4 running
at 80 MHz with 1.55 DMIPS/ MHz = 124 MDMips. The SAM3U is an M3
running at 96 MHz with 1.25 DMIPS/MHz = 120 MDMips.

I am looking at developing a new transceiver based on the UHFSDR. I envision 2 receiver strips and one transmitter strip. That would allow cross-banding as in the FT-8800(with VHF or UHF to HF also). Separate strips would cut out some of the transmit/receive switching and could allow duplex operation(with sufficient freq. separation and filtering).

I have been looking at controller chips. The ATMEL ATSAM3UXX looks really good and is cheap(well under $10 qty 1 and under 5 at qty 25) from Mouser and Digikey. They are based on the ARM M3 and have 64K, 128K, or 256K Bytes of Flash program memory, 20K to 52K Bytes of RAM, a High Speed USB interface, I2C, I2S, timers, etc, plus a bootloader in ROM. Some DSP instructions are included as well. Only bad is only in 100 or 144 pin TQFP or TQBGA packages. The TQFP's are doable by hand(.5mm pin spacing).

Does anyone have any experience with them. Would it be possible to hang one or 2 stereo A/D's onto the I2S bus and decode SSB, CW, and NFM plus data modes? I think it should have enough horsepower to do that over a narrow band without the waterfall.

The receiver strips would include a set of selectable BPF's(similar to my small BPF board). The transmit strip would have enough output to drive a 100W amp. My MPLPF board would be used for the transmit LPF.

I also found 2.6" and 3.5" touch screen TFT LCD displays (240 X 320) for $8 and $15!

1368. SAQ 17.2KHz 24-12-2012 reception

Yahoo group: UHFSDR
Date: 2012-12-25 18:51:43 UTC
From: SW1IXP
Topic: 1368 Message: 1368

A successful reception of SAQ's transmission in Grimeton at 24-12-2012 has been made in Athens, Greece. A 5 meter vertical wire was used as the antenna , feeding a VLF upconverter. The upconverter's output was then fed to an SDR (built around the UHFSDR and USB2SDR boards). The XVTR capabilities in PowerSDR were used so as to display the correct frequency.

Hi Bob,
i built a similar configuration with UHFSDR & SDR2GO which works really fine (except the only +11dBm TX@430Mhz). You seem to have solved the next challenge (switching / filterin / amplifying different dedicated bands) very elegant. Do you have some more information on the SP4T switching boards , the TX AMps and the LNAs ?

Main interrest is around 400-500Mhz, as i will be using it as an exciter for my microwave transverters (10, 24, 67 Ghz)

Hi Dave et All

☐Map Widget☐ is a nonsense generated by Google Translate :-)) In fact, the question should have been asked on the SDR-Widget mailing list, but some recent thread written by Larry W9AMR justified this demand

More precisely :

Michel is quite aware that the L.O. division ration cannot be change in the UHFSDR itself. He is using it for more than 3 or 4 years and built 8 or 9 different SDR systems.

He recently built George☐s SDR-Widget µC/audio/USB interface card, and wonder how to use it to drive the Si570 located on the UHFSDR. From scratch, the firmware of the Widget is designed to drive a softrock based transceiver, with a ☐by 4☐ division ratio of the local oscillator. And he was wondering how to change this division ratio ☐in☐ the SDR-Widget to command and control the UHFSDR without having a wrong frequency on the LDC display of the widget.

I think I don☐t betray Michel☐s thought

73☐

Apologies for cross posting (as well on PowerSDR-IQ) but trying to get an answer before I go mad:

I have scoured all the groups for the answer to this but have failed:
I just installed PowerSDR v2.4.4 for Homemade Rigs, having been successfully using PowerSDR-IQ v 1.12.20 with the UHFSDR, Delta 44 sound card and QRP2000 USB controlled Si570 synthesiser modified to drive the SI570 on the UHFSDR. This uses the ATTiny45 programmed with DG8ASQ firmware. PowerSDR-IQ had the necessary tick box for the UHFSDR divide-by-2 operation. However, I cannot get the same functionality with the new version. It is driving the Si570 OK, but at 2X the needed frequency - i can for instance receive 70.00MHz at a setting of 35.009MHz. I found a suggestion about using SdrSi570Usb.dll, but PowerSDR v2.4.4 doesn't recognise this. I tried renaming SdrSi570Usb.dll to SdrSi570Usb.dll but that made no difference.
Any help would be most welcome.
Tony

1377. Full Kits

Yahoo group: UHFSDR
Date: 2013-01-25 18:00:44 UTC
From: The Silver Fox
Topic: 135 Message: 1377

I want to thank all of you who have purchased the full kit from me over the years. The current interest in the kits appears to be waning and I cannot afford to purchase another bulk buy of the Si570s without more cash flow. If you are currently considering purchasing the full kit, please do so soon else I will have to announce a halt in production. I need about five more purchases to kick off the new batch of kits. For those interested, I am willing to encourage the purchase by offering $10 off the price in my signature. If I don't get enough orders, I will refund your money within six weeks.

73,

Alan - W6ARH

For those interested, I am negotiating buying more si570's for future kits. The vendor is quoting me a price that is $26 a chip higher in cost than my last purchase. So, I am interested in what the impact would be for me to pass on my costs in the kit price. Realize while contemplating it that I have to add the tax, shipping and cost of money to that increase.

I am currently out of stock for the Si570's and I am trying to negotiate a better price with the vendor. The bad news is that I cannot accept further orders without the caveat of a price increase.

Hopefully, this will be resolved this week and then there is a four week wait for new chips. Thank you for your support.

Alan
I really hope you have success. As a newbie I have been waiting to see this ordering system resolved. It has had me worried. Ordering then waiting 4 weeks is not fun. My goal was to have this part of my backpacking trip this summer. So should look at other all band HF kits, Until you get this resolved? Sorry to see this one falling apart. Thanks

Hi Dean,
Alan cannot sink money into stock that won't shift easily so he needs to ensure there are enough orders to justify the outlay to provide kits at a reasonable price.

He is only a volunteer who has graciously taken on the project after Art could no longer devote time or resources to it. If he hadn't it would have folded a long time ago.

I am still negotiating with the vendor and have some hope that the price will be more acceptable than what they recently quoted. As noted, there is a minimum quantity that has to be ordered just to get them and every dollar in price increase adds considerably to the cost outlay. On the more positive side if there is sufficient interest and a reasonable order rate, there would be less anxiety over the purchase.

Alan
I really hope you have success. As a newbie I have been waiting to see this ordering system resolved. It has had me worried. Ordering then waiting 4 weeks is not fun. My goal was to have this part of my backpacking trip this summer. So should look at other all band HF kits, Until you get this resolved? Sorry to see this one falling apart. Thanks
Dean

I just went to silabs.com and put an "A" grade, LVPECL, 19.982
default freq, in their cart. The cart does not automatically come up in
Chrome. Had to redo it in IE. But you can go to the cart at
<http://www.supplier-direct.com/silabs/Cart.aspx> after you put it in in
Chrome
Price listed was qty 1 = $98.80, qty 25 = $71.14 each.

Thanks for the information. The last time I wanted to buy some SI told me that they would not sell them to me directly even though they did the previous purchase. The number you found is interesting since it is $11 cheaper than what I've been quoted although I'd expect some markup by the middlepeople. It will be interesting to hear what the BFO will be.

Hi Alan,

You could try offering the kit without the Si570 as an option. I can easily source them in the UK, probably not for the prices you could get them for but it is an option for those of us who have another source of supply.

Topic: 1386 Message: 1397

I haven't come across a source here in the UK that will sell in quantities of less than 1000 and my brother encountered the same problem in Florida when he too was referred to those local representative companies by SiLabs.

I can't see how spending more in 2 transactions to get the same UHFSDR kit works out cheaper than spending less in one.

I keep thinking I'm missing something in the logic that would conclude the 2 transaction method as the cheaper way.

Even on the supply side if 30 kits are ordered and only 15 with si570's it wouldn't make sense to do a kit anyway.

Alan, may be the way to tackle it is to supply kits only with si570.

Hi Sid,

In the UK, you should have no problem to obtain the Si570 since
SDR-KITS.net sells them in single quantities at reasonable prices.

In Germany, there is BOX73, but only up to the B-grade.

73, Rainer

OK, works out at around $74.00.
qty 25 = $71.14 each still makes buying a full kit worthwhile.

Sid,

Just because you haven't found one it doesn't mean that one doesn't exist. Take a look at http://www.sdr-kits.net/Webshop/products.php?53. Jan, G0BBL, who owns SDR_Kits has been supplying these in single quantities to the ham radio community for years. A simple Google search on "Si570 SDR" would have told you this. Also they are available through Digikey.

Much as I would hesitate to give an ex IBM mainframe engineer a lesson in logic I'll give it a go:-

If the only criteria preventing Alan continuing the UHFSDR kits is availability of Si570s then if people source their own Si570s the problem is solved. Also this option allows people to choose the grade of Si570 they want, which may not be the one provided in the kit.

At the end of the day it is Alan's business and his choice, not yours or mine. I am just trying to help keep these great kits in production.

I just went to silabs.com and put an "A" grade, LVPECL, 19.982 default freq, in their cart. The cart does not automatically come up in Chrome. Had to redo it in IE. But you can go to the cart at http://www.supplier-direct.com/silabs/Cart.aspx>http://www.supplier-direct.com/silabs/Cart.aspx> after you put it in in Chrome

Price listed was qty 1 = $98.80, qty 25 = $71.14 each.

Hi Dean,

Alan cannot sink money into stock that won't shift easily so he needs to ensure there are enough orders to justify the outlay to provide kits at a reasonable price.

He is only a volunteer who has graciously taken on the project after Art could no longer devote time or resources to it. If he hadn't it would have folded a long time ago.

Si570's come in different capabilities with price reflective of quality.
The only fair comment on price comparisons is to provide the details like
Dave did.

Hi To all:
I hope I didn't step on toes and sound insensitive. How well I know about cash flow issue with this economy. I don't want to see this project disappear in fact my reason for my backpacking trip is to promote these style kits. And this sounds like the correct one to Promote.
My level of taking on this project it to learn and grow in Ham Radio.
I don't like that Alan is saying he may drop the whole thing. As a group how do we rally around and keep this going.
Do we create a pool of funds to keep this going?
How is this type of project protected?

Guys I'm really going to open up and explain why it has been hard for me (I believe others) to pull the trigger and buy.... Well other than the holiday mass exodus of cash flow.
When I started looking at this kit I looked for the understanding how to build this from my lack of electrical understanding.
This seems to be for Electrical engineers or well educated in electronics to build. The instructions don't take a guy like me who doesn't have the shake (yet) a step by step guide to build and test. So this makes since. The area of interest will not self propitiate it will diminish instead.
Now Gently there have been two websites that show you a pictural how to build. But no understanding how to test as you build. With out those steps it is a pain to find the mistakes at the end of the project. Instead of finding the bad solder joint or bad part early on.

This is all from my prospective and maybe you don't want us newbies involved.
So of course the interest will diminish.

Guy's I like the sound of this project. I think you have a great opportunity to revitalize interest. but you got to open it up to some less then engineers so they can infuse it and keep it going!!!! then this may create a further direction.

I want in and If this really does work and is worth the end result then lets keep it going.

Thanks
Dean Smart

From: Sid Boyce
Topic: 1386 Message: 1405

I hadn't been to Jan's site in quite a while and back then he was only stocking the si570C. It was back when the UHFSDR first appeared, every one of the si570A samples I got from SiLabs failed as did one donated by G1CET and it was almost a year before I got a working one from George Boudreau.

I am not disputing that the choices are Alan's but from the start he shipped full kits including the si570A while WB6DHW later supplied partial kits with the hard to find devices.

I was only pointing out that the more full kits he supplied, it would be easier for him to stock up on si570's.

I have seen projects on the brink of failure and some failed for lack of sufficient interest or support - the SDR-Widget being a prime one.

BTW, having said that, Alan can speak for himself.

The only grade "A" he has is a Si570DBA. That has a CML output.
That should work on the UHFSDR. May require a change in the resisters
in the circuit between the Si570 and the flip flops. If someone else
has used a CML output, let us know. SDR-Kits also has some 945 MHz
LVDS. LVDS will work with different resisters(the values are indicated
on the schematic) and the upper transmit/receive frequency limit would
be limited to 945/2 = 472.5 MHz. That would cover 70cm. Has anyone used
the "B" and had it work on 70 cm ?

Topic: 1386 Message: 1408

I have tried to support these projects because they serve a good purpose
and open up interesting areas for experimentation.
Over a period of almost 9 years, my SDR gear, not because I definitely
needed them but because they are fun and a challenge as well as a means
of supporting the projects and getting others interested:-
SR v6.3 and Mobo v3.6 + K5BCQ si570 Controller (x2)
UBW (x3)
K5BCQ SDR2GO, 20W PA and BPF kit
SR63ng + Mobo v4.3.4 + SDR-Widget
UHFSDR (x2) + SDR-Widget (x2)
Ensemble II - donated to a guy Stateside for Softrock software development

Ensemble RXTX (x4) - 1 for a guy in Kent and the 1 to the guy developing
software for the HiQSDR, USRP, Softrocks and other SDR gear. The guy in
Kent is blown away by the RXTX and should have been showing it off at
his club meeting last night to get them interested in adding Softrock to
their club projects.

SR63ng + Mobo v4.3.4
SDR-Widget
HiQSDR + Preselector/10W PA
Funkamateur 1W PA's (x2)
HPSDR Hermes about to be ordered.
73 ... Sid.

Hi To all:

I hope I didn't step on toes and sound insensitive. How well I know about cash flow issue with this economy. I don't want to see this project disappear in fact my reason for my backpacking trip is to promote these style kits. And this sounds like the correct one to Promote.

My level of taking on this project it to learn and grow in Ham Radio.

I don't like that Alan is saying he may drop the whole thing. As a group how do we rally around and keep this going.

Do we create a pool of funds to keep this going?

How is this type of project protected?

Guys I'm really going to open up and explain why it has been hard for me (I believe others) to pull the trigger and buy.... Well other than the holiday mass exodus of cash flow.

When I started looking at this kit I looked for the understanding how to build this from my lack of electrical understanding.

This seems to be for Electrical engineers or well educated in electronics to build. The instructions don't take a guy like me who doesn't have the shake (yet) a step by step guide to build and test. So this makes since. The area of interest will not self propitiate it will diminish instead.

Now Gently there have been two websites that show you a pictural how to build. But no understanding how to test as you build. With out those steps it is a pain to find the mistakes at the end of the project. Instead of finding the bad solder joint or bad part early on.

This is all from my prospective and maybe you don't want us newbies involved.

So of course the interest will diminish.

Guy's I like the sound of this project. I think you have a great opportunity to revitalize interest. but you got to open it up to some less then engineers so they can infuse it and keep it going!!!! then this may create a further direction.

I want in and If this really does work and is worth the end result then lets keep it going.

Thanks

Dean Smart

1410. Good News

Yahoo group: UHFSDR
Date: 2013-01-30 23:18:31 UTC
From: The Silver Fox
Topic: 1410 Message: 1410

I have cajoled the vendor into giving me the previous price for the Si570's so there is no increase for the chips. However, shipping costs have steadily risen so I will be asking a few dollars more for the kits.

There is no reported delay when I purchase the chips so all is well. See my signature for the current price. As noted I am investing in 25 more chips so please keep the orders coming and thanks to all for the moral support and good words regarding the product.

Alan Hurray! thanks for sticking in there.

How far from out are you for those 10 kits?
Or is this still an issue?
Then how far out from delivery?

Thanks

Topic: 1410 Message: 1416

I offered to discount interim purchases that allows me to buy more inventory without investing my own money. This offer did not produce any buyers.

1417. PowerDSR and UHFSDR ???

Yahoo group: UHFSDR
Date: 2013-02-01 12:21:41 UTC
From: bent_andersen@ymail.com
Topic: 1417 Message: 1417

HI all

I installed Powersdr 2.4.4 and it has the possibility to
divide by 4 but would like to use 2 as my UHFSDR requires.
Now the question is ... what do you use instead ???, is there a early
version of powersdr that is "made" for the UHFSDR ???

1418. UHF-SDR kit

Yahoo group: UHFSDR
Date: 2013-02-01 16:10:14 UTC
From: Mihai Dumitru
Topic: 1418 Message: 1418
Attachments: 1 described; binary payloads are missing from this source WARC

Hi everyone,

For the moment I have a new hobby and I'm no longer interested in radio. So, I have decided to sell my UHF-SDR kit.

The kit contains:
- all the parts (including resistors and capacitors),
- an SI570BBB000141DG (10-810MHz, LVDS, 20ppm, Start-up frequency: 56.32 MHz),
- the original WB6DHW PCB (unplanted),
- a PCB projected by me which contains an ATTINY85-20SU for USB connection development.

I think 150$ + 10$ shippment is a fair price.
If someone is interested, please mail me.

73's to all

its been awhile since iv used powersdr .... i use HDSDR when on windows ..

i seem to recall that there was a file you were saposed to replace in powersdr folder for the UHFSDR divide by 2 ....
but i just dont recall ... maybe some one else will remember ... or refer us to a link with the information your looking for ...

Bob,

I have been working on my SDR2GO to UHFSDR interconnects trying to get them working and was wondering if you could share what you did.

From your photo's, it looks like on your SDR2GO board you left off U5 or maybe I just can't see it.

I have my UHFSDR working for a while now via a LPT port and a PC, and I completed my SDR2Go board but when I try to supply the SDA/SDL signals through J5 from the SDR2Go to pins 3/4 of H2 on the UHFSDR, the SDR2Go board lockes up.

I have the address on the SDR2Go set to 55hex and the startup frequency to 19,982,000 with a divisor of 2 which from what I read should be fine given my Si570 and what little I know if the UHFSDR.

I am a little confused on what I should see on the SDA/SCL lines. If I check the voltage with the two boards disconnected, on the SDA/SDL on the SDR2Go I get 3.2V but on the SDA/SCL on the UHFSDR I get 4.6v which I didn't think should be the case. I removed the pull up resistors R59/R60 per comments on the forum which I though would have removed the voltage from these pins.

The SDR2Go board starts up fine independent of the UHFSDR, but the minute I connect the SDR2Go SDA/SCL lines to the UHFSDR, with or without power the SDR2Go board lockes up. I think it has something to do with the voltages I am seeing. Maybe my ADUM1251 has gone bad, don't know.

In any case, it looks like you have done an excellent job on your Warthog. I was trying to get mine to the piglet stage, then maybe it would grow up over time.....

PowerSDR-IQ has support for divide by 2. I have used version 1.12.20
available at
<http://code.google.com/p/powersdr-iq/downloads/detail?name=PowerSDR-IQ%20v1.12.20%20Setup
.msi&can=2&q=>
There is a link to the download page in the group links. I haven't
yet tried PowerSDRv2.4.4 for homemade_Rigs yet.

Replying to my own message... I must be talking to myself. Well I tried the crazy idea of tying pin 2 of H1 back to ground and what do you know, I have control of the Si570 from my SDR2Go board and can see some of the signals on it's graphics interface.

My piglet started to oink!

Hi guys,

Bent, you can have a look at this folder
-> http://groups.yahoo.com/group/powersdr-iq/files/PowerSDR_v2.4.4_Homebrew_Div2/

Its freshly baked and got just out of the oven.. :-)

It has the divider by two as required by UHFSDR and a upper VFO frequency of 999 MHz.

Of course it requires the USB to I2C ATTiny controlling the UHFSDR's Si570.

Its not tested but you can give it a try and let us know.

Hi

I have just posted this in the PowerSDR-IQ group, but in case you UHFSDR owners do no look at that group, I am posting it here:

Hi Christos

I have done some more investigation and have concluded that you have changed the divider ratio in the wrong direction. With my UHFSDR if I tune the new software to 20MHz, I am receiving on 79.9671MHz which is 4X the set frequency minus 4 X IF offset. Clicking the SR button changes this offset from 25.6 to 32.5 kHz.

Nearly there - I am sure. Is there anyone near who can lend you a UHFSDR?

Tony

Tony,
As you see, it works for others.
It looks to me that you dont have replaced the two files as specified on the instructions.

You have to manually use the VFO.
Go to VFO dial and change the frequency directly.

HI Christos

The new version "Div2" work ok at 1-50mhz ...but it will not run on

144mhz ??? I use the ATTiny controller v15.15

What were your dividers set to in the AVR ?

To: UHFSDR@yahoogroups.com
From: tabbey01@...
Date: Mon, 4 Feb 2013 13:09:49 +0000
Subject: [UHFSDR] Re: PowerDSR and UHFSDR ???

Hi

I have just posted this in the PowerSDR-IQ group, but in case you UHFSDR owners do no look at that group, I am posting it here:

Hi Christos

I have done some more investigation and have concluded that you have changed the divider ratio in the wrong direction. With my UHFSDR if I tune the new software to 20MHz, I am receiving on 79.9671MHz which is 4X the set frequency minus 4 X IF offset. Clicking the SR button changes this offset from 25.6 to 32.5 kHz.

Nearly there - I am sure. Is there anyone near who can lend you a UHFSDR?

Tony

OK .. here's my report ...

multiplier is working correctly ...

when i go past 100mhz the leading digit is not being taken, though you can enter 146.58(Mhz) the AVR is sent only to go to 46.58(hz)

thats progress though ...

From: sv1eia
Topic: 1417 Message: 1436

Have you set it up according to instructions, exactly?

Have you started the application as SDR1000?

Do you have the latest firmware in the ATTiny? (v15.15) so to have PE0FKO Command 0x32 support?

I dont know why you cannot have the 999MHz shown, I guess there is something wrong in file replacement. You have to be able to see this VFO indication at least up to 999MHz by dialing directly on the VFO dial.

ok, at that time i had not tried ... since it used to not go above 60Mhz ....

its progress .... one little hickup ....

HI Mike

yes I can save and recall...pse look in my Photo-album, I have upload a picture of it...
sorry but small ;-)

I can here the local FM-radio on 105mhz no problem...but it
wil not recive any signal on 144mhz ???

is there any "setup" in the SI570 I forgot ??

From: tony_g3ovh
Topic: 1417 Message: 1439

Hi Christos
I have indeed replaced the files as required. However, I think I know the problem now from your other comments. I have never used the CFGSR configuration program, since PowerSDR-IQ took care of the offsets and division in the setup. I downloaded CFGSR which reports my USB AVR Si570 as having V1.4 firmware. Perhaps this is not compatible. The CFGSR application is able to set the required X2 frequency and can correctly calibrate the xtal oscillator and correctly tunes the Si570 from its own tuning tab, but I do not understand how those calibrations get into the new PowerSDR setup - as soon as I touch the frequency scale on PowerSDR it reverts to the X4 frequency and 9kHz offset.
I do not have a means of reprogramming the firmware on the AVR chip, and couldnt find a source of pre-programmed parts on the web. It looks like I will have to stay with the old PowerSDR-IQ version. As far as I can see, the only difference is the new (black) look anyway, buy perhaps there are changes inside that make it operate better.
cheers
Tony

> > Hi Christos
> >
> > I have done some more investigation and have concluded that you have changed the divider ratio in the wrong direction. With my UHFSDR if I tune the new software to 20MHz, I am receiving on 79.9671MHz which is 4X the set frequency minus 4 X IF offset. Clicking the SR button changes this offset from 25.6 to 32.5 kHz.

1440. Re: PowerDSR and UHFSDR ???

Yahoo group: UHFSDR
Date: 2013-02-05 20:08:24 UTC
From: sv1eia
Topic: 1417 Message: 1440

Bent,

If you go to the VFO-A and type 999, or with the roll of your mouse go up, does it show afterwards the frequency as shown here at 999MHz?
-> http://groups.yahoo.com/group/UHFSDR/files/SV1EIA/999MHz.pdf

can you make the VFO-A go at higher frequencies?

If you can set high frequencies to VFO-A dial, then check with a frequency meter the LO output from your Si570.

For VFO of 105 MHz it should have LO of 210MHz(-18KHz) at Si570's output and at VFO of 144MHz it should have 288MHz(-18KHz).

As a remark, make sure that you have the proper Si570 grade attached on your ATTiny..

Frequency Grade
Code Frequency Range Supported (MHz)
A 10-945, 970-1134, 1213-1417.5
B 10-810
C 10-280 (CMOS available to 160 MHz)

73,
Christos SV1EIA

Ok Tony,

It looks that the firmware is making something there.
I do not have much experience at this, yet what is needed is that ATTiny should accept the 'direct' frequency of plain X 1 and no IF since the X 2 multiplier and the IF are handled by PSDR. These are pre-calculated and given included in the requested frequency to the firmware.
So ATTiny firmware should not act on its own and add multipliers or IF on a given freq.

I'm saying about the latest PE0FKO firmware since the new ones have proper high frequency support up to 2GHz of LO.

I hope these help.

73,
Christos SV1EIA

>
> Hi Christos
> I have indeed replaced the files as required. However, I think I know the problem now from your other comments. I have never used the CFGSR configuration program, since PowerSDR-IQ took care of the offsets and division in the setup. I downloaded CFGSR which reports my USB AVR Si570 as having V1.4 firmware. Perhaps this is not compatible. The CFGSR application is able to set the required X2 frequency and can correctly calibrate the xtal oscillator and correctly tunes the Si570 from its own tuning tab, but I do not understand how those calibrations get into the new PowerSDR setup - as soon as I touch the frequency scale on PowerSDR it reverts to the X4 frequency and 9kHz offset.
> I do not have a means of reprogramming the firmware on the AVR chip, and couldnt find a source of pre-programmed parts on the web. It looks like I will have to stay with the old PowerSDR-IQ version. As far as I can see, the only difference is the new (black) look anyway, buy perhaps there are changes inside that make it operate better.

> > > Hi Christos
> > >
> > > I have done some more investigation and have concluded that you have changed the divider ratio in the wrong direction. With my UHFSDR if I tune the new software to 20MHz, I am receiving on 79.9671MHz which is 4X the set frequency minus 4 X IF offset. Clicking the SR button changes this offset from 25.6 to 32.5 kHz.

Topic: 1417 Message: 1442

Christos,

would it matter if i had an older install of flex 2.4.4,

I have a 15.15 AVR and the only thing i noticed was that the max freq sent to the AVR was 99.999Mhhz .... once 100Mhz was hit the freq sent to the AVR was 00.00 ... etc, 144.90Mhz was seen on PE0FKO's(CFGSDR ?? man still cant remember PE0FKO's avr setting program's called) as 44.90Mhz ...

Dues to the fact that i have a dead display now makes it real tough to reproduce/test/change anything ..... for me to report.

I can enter any freq in VFO A .... even 470Mhz ... but what it reported by CFGSDR is --- well i dont rememebr now .... if it was 70Mhz or what ..... i think ill go to the garage and haual it all inside to my wife's laptop (what im using right now)

Subject: [UHFSDR] Re: PowerDSR and UHFSDR ???

Bent,

If you go to the VFO-A and type 999, or with the roll of your mouse go up, does it show afterwards the frequency as shown here at 999MHz?

-> http://groups.yahoo.com/group/UHFSDR/files/SV1EIA/999MHz.pdf

can you make the VFO-A go at higher frequencies?

If you can set high frequencies to VFO-A dial, then check with a frequency meter the LO output from your Si570.

For VFO of 105 MHz it should have LO of 210MHz(-18KHz) at Si570's output and at VFO of 144MHz it should have 288MHz(-18KHz).

As a remark, make sure that you have the proper Si570 grade attached on your ATTiny..

Frequency Grade

Code Frequency Range Supported (MHz)

A 10-945, 970-1134, 1213-1417.5

B 10-810

C 10-280 (CMOS available to 160 MHz)

73,

Mike,

That resembles behaviour of some older firmware where limitations to frequency existed. Double check your fw version.

1444. RE: [UHFSDR] Re: PowerDSR and UHFSDR ???

Yahoo group: UHFSDR
Date: 2013-02-05 20:51:34 UTC
From: MIKE DURKIN
Topic: 1417 Message: 1444

Sure .. can do .... but, with HDSDR, iv listened to my local 223.6Mhz trunk ..... on the same windows install.

To: UHFSDR@yahoogroups.com
From: sv1eia@...

Subject: [UHFSDR] Re: PowerDSR and UHFSDR ???

Mike,

That resembles behaviour of some older firmware where limitations to frequency existed.

Double check your fw version.

From: sv1eia
Topic: 1417 Message: 1445

Ok, but I dont know how hdsdr is utilizing the fw, as I said I use its 0X32 direct frequency set command.
They might use the older Si570 register set which is a different method.

1446. RE: [UHFSDR] Re: PowerDSR and UHFSDR ???

Yahoo group: UHFSDR
Date: 2013-02-05 21:05:59 UTC
From: MIKE DURKIN
Topic: 1417 Message: 1446

ok, im using my wife's puter, win7 ...

so to use this X32 support? .... I have firware 15.15 reported from
PE0FKO's build is 602 V2.06

Mike KC7NOA

oh.. and yea.. when 447Mhz is in VFO A, PE0FKO shows 47Mhz .....

To: UHFSDR@yahoogroups.com
From: sv1eia@...

Subject: [UHFSDR] Re: PowerDSR and UHFSDR ???

Ok, but I dont know how hdsdr is utilizing the fw, as I said I use its 0X32 direct
frequency set command.

They might use the older Si570 register set which is a different method.

From: sv1eia
Topic: 1417 Message: 1447

Can you verify this with an RF frequency counter on Si570's output?

It looks that you have both PSDR and CFGSR accessing the device concurrently, that is not a good thing if of course you do it.
Dont have anything else accessing the USB device appart from PSDR.

If you have the v15.15 then the X032 command is already included, you dont need to do anything.

1448. RE: [UHFSDR] Re: PowerDSR and UHFSDR ???

Yahoo group: UHFSDR
Date: 2013-02-05 21:23:07 UTC
From: MIKE DURKIN
Topic: 1417 Message: 1448

The PE0FKO is set to load freq on the tune tab .... at 99.98Mhz .. thats also what PE0FKO shows, when i go above that ... it seems to use only the right most two digits left of the decimal point ... leaving "1"44 -- "1" not sent i guess ...

I dont have power for the radio .... only the AVR is powered right now ....

Subject: [UHFSDR] Re: PowerDSR and UHFSDR ???

Can you verify this with an RF frequency counter on Si570's output?

It looks that you have both PSDR and CFGSR accessing the device concurrently, that is not a good thing if of course you do it.

Dont have anything else accessing the USB device appart from PSDR.

If you have the v15.15 then the X032 command is already included, you dont need to do anything.

Topic: 1417 Message: 1449

Hi Christos

I see you are busy with Mike's problem presently. I would be interested to know what the divider setup is that other's are using where it is working. In any case, from what you said, it looks like you need no divide or offset in the firmware or DLL. Perhaps the default condition is with multiply by 4 permanently set, and then this new command you mention bypasses it to give straight no multiply of offset. And perhaps my V1.4 version doesnt have that. Except it works OK with PSDR-IQ - can you tell me how that interfaces to the Si570 - both parallel port and USB gave the correct divide ratio for the UHFSDR.

> > Hi Christos
> > I have indeed replaced the files as required. However, I think I know the problem now from your other comments. I have never used the CFGSR configuration program, since PowerSDR-IQ took care of the offsets and division in the setup. I downloaded CFGSR which reports my USB AVR Si570 as having V1.4 firmware. Perhaps this is not compatible. The CFGSR application is able to set the required X2 frequency and can correctly calibrate the xtal oscillator and correctly tunes the Si570 from its own tuning tab, but I do not understand how those calibrations get into the new PowerSDR setup - as soon as I touch the frequency scale on PowerSDR it reverts to the X4 frequency and 9kHz offset.
> > I do not have a means of reprogramming the firmware on the AVR chip, and couldnt find a source of pre-programmed parts on the web. It looks like I will have to stay with the old PowerSDR-IQ version. As far as I can see, the only difference is the new (black) look

anyway, buy perhaps there are changes inside that make it operate better.

> > > >
> > > > I have done some more investigation and have concluded that you have changed the divider ratio in the wrong direction. With my UHFSDR if I tune the new software to 20MHz, I am receiving on 79.9671MHz which is 4X the set frequency minus 4 X IF offset. Clicking the SR button changes this offset from 25.6 to 32.5 kHz.

> > Hi Christos

> > I have indeed replaced the files as required. However, I think I know the problem now from your other comments. I have never used the CFGSR configuration program, since PowerSDR-IQ took care of the offsets and division in the setup. I downloaded CFGSR which reports my USB AVR Si570 as having V1.4 firmware. Perhaps this is not compatible. The CFGSR application is able to set the required X2 frequency and can correctly calibrate the xtal oscillator and correctly tunes the Si570 from its own tuning tab, but I do not understand how those calibrations get into the new PowerSDR setup - as soon as I touch the frequency scale on PowerSDR it reverts to the X4 frequency and 9kHz offset.

> > I do not have a means of reprogramming the firmware on the AVR chip, and couldnt find a source of pre-programmed parts on the web. It looks like I will have to stay with the old PowerSDR-IQ version. As far as I can see, the only difference is the new (black) look anyway, buy perhaps there are changes inside that make it operate better.

With my UHFSDR if I tune the new software to 20MHz, I am receiving on 79.9671MHz which is 4X the set frequency minus 4 X IF offset. Clicking the SR button changes this offset from 25.6 to 32.5 kHz.

Subject: [UHFSDR] Re: PowerDSR and UHFSDR ???

Can you verify this with an RF frequency counter on Si570's output?

It looks that you have both PSDR and CFGSR accessing the device concurrently, that is not a good thing if of course you do it.

Dont have anything else accessing the USB device appart from PSDR.

If you have the v15.15 then the X032 command is already included, you dont need to do anything.

From: tony_g3ovh
Topic: 1417 Message: 1452

Hi Mike

I get something similar but for a more obvious reason - to receive on 4m (70MHz) I need to set the Rx frequency to 17.5MHz, so the s/w thinks it is in a non amateur band so wont let me transmit. I suppose it would have similar problem with filter selection when that's implemented.

Tony

1453. Re: PowerDSR and UHFSDR ???

Yahoo group: UHFSDR
Date: 2013-02-06 09:03:31 UTC
From: sv1eia
Topic: 1417 Message: 1453

Tony,

Go to the cfgsr page
-> http://www.pe0fko.nl/CFGSR/
and look at the 'LO' tab.

It looks that you have placed multipliers there (probably X4), whereas as I said the firmware should treat incoming requests as X 1 with no IF since these are already handled by PSDR.

So most likely the firmware is multiplying the frequency by itself. You need to have 1 in 'Mutliply' and 0 in 'Offset' on the LO: Total.

73,
Christos SV1EIA

Hi Christos

I have played with those multipliers on the LO tab several times - they only affect the 'TUNE" tab, not PSDR. The LO Firmware entry shows Multiply 1 and Offset 0, but they are both greyed out and so are the Read and Save buttons. I have done a search for rogue copies of files which might be in use but hidden. Can you tell me which dll's are used by PSDR - I have copied across both ExtIO_Si570.dll and SRDLL.dll from the CFGSR folder into the PSDR v2.4.4. folder in the forlorn hope that they might be used. So far, whatever I do had had no effect on PSDR. The only anomaly I have found so far is that the CMDSR command line program doesn't change the Si570 frequency - it reports a USB error if CFGSR is open, and OK if CFGSR is closed, and correctly gives the firmware, V1.4, and correctly operates the PTT. However the -f command does not set the frequency (in Hz).
I'm not sure whether the above is relevant, but someone might like to comment.
The mystery continues!
Tony

Hi Tony,

The files you mention are not relevant..

Please go through the included .pdf file of the archive here
-> http://groups.yahoo.com/group/powersdr-iq/files/PowerSDR_v2.4.4_Homebrew_Div2/
and see specifically the step .3.
The relevant files are "Sdr1kUsb.dll" and "PowerSDR.exe".

Also, regarding your remarks on multiple apps concurrently accessing the device, as said many times, only one application has to do that at a single time.

Hi Christos

Can't get me with that one - I only put the extra files there as an experiment, and of course they made no difference. Please confirm that the 2 correct files are:

PowerSDR 4,684KB 03/02/2013 12:00
Sdr1kUsb.dll 89KB 03/02/2013 11:59

There are many other observations I made below about the way the PE0FKO system works - I could do some more debugging if someone could throw some light on how the code all fits together. The main thing I need to know is if the AVR code V1.4 is wrong for this application because the Read and Save buttons are greyed out on the LO tab of CFGSR.
If so, then, Christos please explain why the same USB interface works OK with PSDR-IQ v1.12.20

Tony

Hi Christos

A little more investigation:
If I use HDSDR and import ExtIO_Si570.dll into its working directory, then the CFGSR window pops up, and operating HDSDR tuning changes the Tune tab numbers. Then the DLL divide and offset in CFGSR can be used to get the correct frequency in the same way as if it were being operated from the Tune tab. In PSDR v2.4.4 div 2 you are not using this, but another DLL - presumably Sdr1kUsb over which CFGSR has no control. Therefore any divider config done from CFGSR is irrelevant - presumably only the cal is relevant because I believe its written back to the eeprom in the AVR. So I still dont understand how anything else in my system can be giving the X4 frequency error.

Tony,

I dont think that spending more time on a older firmware will give you anything new.
Just upgrade it and save the hasle, its so easy.

Regarding the files and programs you mention, dont mix them too much.
The situation is very simple, PSDR files have nothing to do with cfgsr files.
The cfgsr files are there only to utilize the ATTiny eeprom and write to it information that later on the ATTiny firmware will use to generate the actual frequency on Si570, either the calibration data or the multipliers and offset.

Aslo, there are two ways to request a frequency from the ATTiny firmware (user is not selecting this), one is by calculating the Si570 registers in application and send them 'raw' to the ATTiny firmware and the other is to specify directly the required frequency. In previous firmware versions there were some issues on how high the frequency could go, yet in the latest, specifically with the direct frequency request, the frequency can go up to 2GHz and that is why I advise you to upgrade.

In PSDR 1.12.x I was using mainly the 'raw' register data (although even that is 'translated' from the ATTiny firmware) whereas in 2.4.4 I prefer using the other new method of direct fequency (command 0x32) due to its high frequency support.

The new version for UHFSDR is nothing more code-wise than its Ensemble counterpart, just the X2 division and the range check of 999MHz.

So, bottom line, my recommendation, just upgrade the firmware which is so easy and some of your issues could be solved.

73,
Christos SV1EIA

Hi Christos

Thanks for the advice. I didnt want to upgrade because I thought it was mainly for the additions for the Ensemble which I dont have. I dont have a means of reprogramming the device, and so far I have not been able to find a supplier selling the programmed chips. The links take you to either SDR-Kits or "Five Dash" who dont seem to be selling the programmed ATtiny 85 micro on its own. If anyone has a source, I would like to know. I'll try and get in touch with SDR-kits who I bought the original QRP2000 USB controller off.

Tony

Then the DLL divide and offset in CFGSR can be used to get the correct frequency in the same way as if it were being operated from the Tune tab. In PSDR v2.4.4 div 2 you are not using this, but another DLL - presumably Sdr1kUsb over which CFGSR has no control. Therefore any divider config done from CFGSR is irrelevant - presumably only the cal is relevant because I believe its written back to the eeprom in the AVR. So I still dont understand how anything else in my system can be giving the X4 frequency error.

The LO Firmware entry shows Multiply 1 and Offset 0, but they are both greyed out and so are the Read and Save buttons. I have done a search for rogue copies of files which might be in use but hidden. Can you tell me which dll's are used by PSDR - I have copied across both ExtIO_Si570.dll and SRDLL.dll from the CFGSR folder into the PSDR v2.4.4. folder in the forlorn hope that they might be used. So far, whatever I do had had no effect on PSDR. The only anomaly I have found so far is that the CMDSR command line program doesn't change the Si570 frequency - it reports a USB error if CFGSR is open, and OK if CFGSR is closed, and correctly gives the firmware, V1.4, and correctly operates the PTT. However the -f command does not set the frequency (in Hz).

Tony,

On Fred's page here
-> http://pe0fko.nl/SR-V9-Si570/#upgrade
is mentioned how to do it or where to buy a pre-programmed one
-> http://www.thepartsplace.k5nwa.com/index.php?route=product/product&path=39_43&product_id=53

73,
Christos SV1EIA

--- In UHFSDR@yahoogroups.com, "tony_g3ovh" wrote:

> Thanks for the advice. I didnt want to upgrade because I thought it was mainly for the additions for the Ensemble which I dont have. I dont have a means of reprogramming the device, and so far I have not been able to find a supplier selling the programmed chips. The links take you to either SDR-Kits or "Five Dash" who dont seem to be selling the programmed ATtiny 85 micro on its own. If anyone has a source, I would like to know.

1461. Price increase for DX

Yahoo group: UHFSDR
Date: 2013-02-09 03:28:14 UTC
From: brainerdd
Topic: 1461 Message: 1461

The latest Post Office price increase increased the shipping cost of my padded envelopes to outside of USA from $3.50 to $6.55!! The price for inside USA only increased from $1.64 to $1.69. As a result, I increased prices on all items by $3 to outside of USA shipping addresses.

I had about the same increase. I vigorously complained to the post office about the major unannounced increase and they told me that it was too bad. If I didn't like it then use another carrier.

That small increase shouldn't deter anyone who is serious. FEDEX and UPS prices are way over the top, so the alternatives are not viable at $60.00+.

Digikey, etc. insist on using FEDEX and UPS so when I need a few dollars worth of parts I have relations order them and post via USPS.

For us Customs look at the items cost + shipping and base duty on that figure.

Ordering from some companies in China, FEDEX and UPS are the default but I get them to use Hong Kong post which works out very cheap and it's also fast.
73 ... Sid.

1464. Software Defined Radio receive test @ 10.368GHz

Yahoo group: UHFSDR
Date: 2013-02-13 14:37:17 UTC
From: Kostas Ioannidis
Topic: 1464 Message: 1464

Receive test of a temporary beacon located about 17km away has been achieved. A homebrew software defined radio (based on the UHFSDR and USB2SDR boards) was used as an IF radio for the VK3XDK X band transverter kit. The test's objective was to evaluate the practical usability (read: Is the screen visible? :) of an SDR on a mountaintop. Overall it was successful with the humble eeepc900 (marginally) getting the job done!

Homebrew SDR info:

So .. ok guess the UHFSDR would be more bulky than a 817 ....
I plan on having a 5"tft on mine ... and hopefully will be able to see a full 96Khz bandwidth at one time ...

Im still trying to workout FM problems (im not using an intel CPU -- might be forced to go that route yet)

1470. Build of older kit?

Yahoo group: UHFSDR
Date: 2013-02-13 20:58:46 UTC
From: Ron
Topic: 1470 Message: 1470

I'm just now getting around to building the UHFSDR kit I purchased many months ago. I'm sure this doesn't matter that much but the kit came with 2 10uF caps that are marked as HV on the parts "strip". Neither the build instructions nor the BOM differentiates any of the 10uF caps, at least that I've been able to see.

So where to these two caps go? My guess is c32 and c39.

Ron

C2 and C39 are the 2. They have the 12V(13.8V) input across them.

Hi Bent,

Nice catch.

As I said I use the 0x32 PE0FKO firmware command, so it might be something there that gives us trouble.
I hope that Fred could see to that too.

Otherwise I'll implement a new Div2 version without using the 0x32 firmware command.

HI Dave

I have now try Powersdr 2.4.4div2 and it works whit a ATTiny v 15.12 interface up to 144mhz but I need also the 432mhz...

the next is I am running win7-64 and I dont think Power-sdr 1.12.2
will run....

... I have also a USB2SDR soundcard and under this, there is no problem...it just run, the only problem whit this usb-sound card is that I cant get the I/Q signal out to my ASIO soundcard and the again in to MAP65 (jt65 program)(I will use my sdr to EME on 144mhz)

so I think the problem is the ATTiny chip...

any Idea wath to do ???

Im using 15.15 .. and yes .... i can go above 500mhz ...

best to take the new CFSGR and paste it into HDSDR folder ....

going by memory that works for the latest ExtIO useage ....

I should see if Wine can handle HDSDR now ....

HI Mike

No I dont think there is somting wron whit HDSDR...just another
way to control the radio..and I have to chek it out...as all
other new software...

I can get PowerSDR 2.44 to run on 144mhz whit ATTiny v15.12
but not on 432mz... the new v15.15 wil only run until 142mhz then
it stop....

I think I will change to USB2SDR + UHFSDR and wait and see if
PE0FKO make a new version for the ATTiny chip... I have write
to him, and waiting for news :-)

1489. Re: PowerDSR and UHFSDR ???

Yahoo group: UHFSDR
Date: 2013-03-09 20:39:51 UTC
From: tony_g3ovh
Topic: 1417 Message: 1489

Hi Christos

I finally got the new ATTiny85 installed with V15.15 firmware. Now it works OK with PowerSDR V2.4.4 X2 version giving the correct receive frequency - thanks for the help. However, I now have a new problem - I want to use this for the UK 4m amateur band 70.0 to 70.5 MHz. I have edited the .xml configuration file to add the correct band texts for the band plan, but cant get Tx enabled. S/W reports "The frequency 70.200000MHz in combination with your TX filter settings [200,3100] are not within the Band specifications for your region (0)." But I can't find where these are specified. Have you emulated the SDR1000 firmware in the extensions to the original code, so that we can't transmit outside the US band plans? This wasn't a problem in PowerSDR-IQ v1.12.20 because I could tick the extended button to allow it. Help please. I'll post in the PowerSDR group as well.

From: The Silver Fox
Topic: 1491 Message: 1491

Any advice for this builder?

73,

Alan - W6ARH

From: Mansueto Grech [mailto:mansueto.grech@...]
Sent: Monday, March 11, 2013 3:24 PM
To: Alan Hill
Subject: Re: Help with SI570

Hi Alan,

Today I found some time and continued on the UHFSDR.

Unfortunately I encountered a problem.

I am now at steps 65-69

my problem is as follows

We have determined that the SI570 supplied is an LVPECL.

Steps 65 & 55the frequency is 20.000 MHz and 20.023Mhz respectively but not squarewave

step 67 the dc offset is more or less OK

but step 68 tp8 and tp9 are not out of phase.

Can you be so kind as to ehelp me with this

Thank you in advance and 73's

Mans. 9H1GB

On 25 February 2013 16:45, Alan Hill <alan.r.hill@...> wrote:

Mans,

The SDR2GO documentation says that you can use the Si570 either way.
You do not have to remove it if installed on the UHFSDR. However, if you have not installed it, then you can use it on the SDR2GO instead of on the UHFSDR board. You need an upvertor if you want to xmit.

If you want to receive only, consider the funcube or any of the RTL2832 USB sticks.

wrote:

Hi Alan,

Thank for the info.

My main aim is to use both from home and portable but mainly portable in conjunction with my Microwave transverters, although I still have to somehow increase the rang to 1.3Ghz for my 24GHz transverter.

I try to document my self on the two systems and at a later stage decide. maybe, as you said something else might crop up.

Oh one other thing if I may, I was reading the SDR2usb presentation and if I recollect correctly the author said that, an this is from memory, to not use the S570 on the UHFSDR but instead use the one on the Board. If so by adding the transformer and not enabling the SI570 will work or I need to take the SI570 off the board.

Thank you very very much for you help and assistance.

Mans. 9H1GB

On 25 February 2013 00:08, The Silver Fox <alan.r.hill@...> wrote:

You are correct on the specifications of the Si570. The SDR Widget is superior to any other sound system. I am not clear on whether or not you can still purchase them. See the sdr-widget group to answer that question. The USBS2SDR is designed to provide the sound and computation for SDR users and to assist in making the system more portable. So, if you want the optimum and intend to work in a shack, the widget is what I would recommend. However, if you want simplicity and portability, then look into the USB2SDR. I am looking into the less expensive solutions with portability as one of the parameters.

The board makers are iterating to smaller and more powerful processors all the time. Secondly, they are integrating better and better A/D and sound chips. Hopefully, the SDR designers will migrate to emerging better technologies.

Subject: Re: Help with SI570

Hi Alan,

Thanks for the info.

Please see attached pic and, If I am not asking too much, confirm if I am correct or not Please.

I see AAA000514G

So it is a 3.3V LVPECL, temp stability 50ppm total stability61.5ppm, 10-945, 970-1134, 1213-1417.5 MHz,etc.

One other thing I am reading that there are couple of systems that USB2SDR and SDR Widget, Which in your opinion is the best of the too?

Thank you very much for your help and assistance

Hi Alan,

I got round to building the UHFSDR FINALLY.

Alan I need your help cause whilst sorting out the parts I seem to have misplaced some of the 10uf 0805 Chips.

Is it possible for me to purchase from you some more as they seem to be lacking here.

I need about 2 but If I can get some more as spare Would be even better.

Can you assist me please.

Thank you in advance

Mans. 9H1GB

Hi Alan,
Thanks fr forwarding the message to Alan.
Sorry forgot to remind you about the 10uf non polarised 0805
Thanks again
and 73's
Mans.9H1GB

1493. Re: [UHFSDR] FW: Help with SI570

Yahoo group: UHFSDR
Date: 2013-03-11 23:57:45 UTC
From: Sid Boyce
Topic: 1491 Message: 1493

They should be anti-phase.

One common problem is soldering, especially pins 7 and 8 where you have
to ensure the main contacts are not bridged to either of the thin strips
either side of the pins.

Check H2- 1 -> 2 are bridged to produce OE High.
73 ... Sid.

1494. Re: [UHFSDR] FW: Help with SI570

Yahoo group: UHFSDR
Date: 2013-03-12 01:34:39 UTC
From: Dave
Topic: 1491 Message: 1494

Mans:
What are you using to measure the frequency? Both test points are the same frequency. It should be 19.982 MHz. TP8 and TP9 can't be in phase if R46-R49 and C59 and C60 are properly installed. Note that for LVPECL, C59 and C60 are 0 ohm resisters! Where is your ground connected and are you using a dual trace oscilloscope? If so, make sure you are not in alternate trace mode. You need both traces to start at the same time. Trigger from TP8 or TP9. To see a good square wave at 20 MHz, you need at least a 100 MHz scope. What amplitudes are you seeing at TP8 and TP9?

Hi Sid,
I have checked for any bridges between pin 7 and 8 I even took the device
off and re-soldered the SI570 with same results.
Yes H2-1 and H2-2 are properly bridged
Thnaks for the help Sid,
73's

1497. Re: [UHFSDR] FW: Help with SI570

Yahoo group: UHFSDR
Date: 2013-03-12 15:27:22 UTC
From: Mansueto Grech
Topic: 1491 Message: 1497

Hi Dave,
My Frequency Counter is an EIP548a.
I have checked R46-49 and are OK And yes they are in phase how I don't
Know. C59 and 60 are 0 ohms.
I am grounding using a screw with a tag in one of the 4 holes on the board.
MY scope is a dual trace scope and is a Hameg HM303-6 35Mhz. Amplitude is
.68 PtoP and sinewave.

Dave I am studying the schematics and I see that R26 (0 ohms) is included
for the SI570 but My Installation Manual say not to install unless you are
using an SI571 Step52. Is this correct?
73's and Thanks
Mans. 9H1GB

From: The Silver Fox
Topic: 1495 Message: 1498

They can be ordered but there is currently a six week shipping queue due to backordered Si570's.

Hi Christos

I now got a new ATTiny v15,14 from K5NWA and install it....BUT it
is the same :-(it stop at 142mhz (si570 stop at 284mhz)...

I have no mail from Fred so I can go back to Attiny v15.12 and only have up to 144mhz on my
UHFSDR :-(

1500. Re: [UHFSDR] FW: Help with SI570

Yahoo group: UHFSDR
Date: 2013-03-12 22:42:14 UTC
From: Dave
Topic: 1491 Message: 1500

Mansueto:
A 35 MHz scope is too slow to show the harmonics of the 19.982 MHz that make up the squarewave. So you see a sinewave because you are not seeing the harmonics. .68VP_P is a little low, but probably OK as a 35 MHz scope is probably down 1 or 2 dB ar 20 MHz. How are you triggering your scope. If you are using internal trigger and alternate mode, they could appear to be in phase. The Si571 has a modulation input pin. On the Si570, that pin is a no connect.

From: Mansueto Grech
Topic: 1491 Message: 1501

Hi Dave,
Thanks for the help.
I'll try to borrow a 100MHz scope from a friend and retest everything.
One other thing I am noticing is that with or without the link from H2-2 to
H2-1 no change is noticed.
Thanks again Dave. I'll let you know the outcome.

1502. RE: [UHFSDR] FW: Help with SI570

Yahoo group: UHFSDR
Date: 2013-03-13 01:29:09 UTC
From: Ronald Wagner
Topic: 1491 Message: 1502

Can't he set the frequency of the si570 to 1MHz (-ish) to see a good signal?

Ron

From: UHFSDR@yahoogroups.com [mailto:UHFSDR@yahoogroups.com] On Behalf Of
Dave
Sent: Tuesday, March 12, 2013 3:42 PM
To: UHFSDR@yahoogroups.com
Subject: Re: [UHFSDR] FW: Help with SI570

Mansueto:
A 35 MHz scope is too slow to show the harmonics of the 19.982 MHz that
make up the squarewave. So you see a sinewave because you are not seeing
the harmonics. .68VP_P is a little low, but probably OK as a 35 MHz scope
is probably down 1 or 2 dB ar 20 MHz. How are you triggering your scope.
If you are using internal trigger and alternate mode, they could appear to
be in phase. The Si571 has a modulation input pin. On the Si570, that pin
is a no connect.

On 3/12/2013 8:27 AM, Mansueto Grech wrote:

Hi Dave,

My Frequency Counter is an EIP548a.

I have checked R46-49 and are OK And yes they are in phase how I don't Know.
C59 and 60 are 0 ohms.

I am grounding using a screw with a tag in one of the 4 holes on the board.

MY scope is a dual trace scope and is a Hameg HM303-6 35Mhz. Amplitude is
.68 PtoP and sinewave.

Dave I am studying the schematics and I see that R26 (0 ohms) is included
for the SI570 but My Installation Manual say not to install unless you are
using an SI571 Step52. Is this correct?

Subject: Re: Help with SI570

Hi Alan,

Today I found some time and continued on the UHFSDR.

Unfortunately I encountered a problem.

I am now at steps 65-69

my problem is as follows

We have determined that the SI570 supplied is an LVPECL.

Steps 65 & 55the frequency is 20.000 MHz and 20.023Mhz respectively but not squarewave

step 67 the dc offset is more or less OK

but step 68 tp8 and tp9 are not out of phase.

Can you be so kind as to ehelp me with this

Thank you in advance and 73's

Mans. 9H1GB

From: Dave
Topic: 1491 Message: 1503

Ronald:
The Si570 could be programmed down to 3.5 MHz. But, at those steps in the assembly, the Si570 is not connected to as programmer. Sounds like his Si570 is working OK. Doing the measurement at that point before programming verifies that the Si570 is working. If you program it and then test, if the output is not correct, you don't know if it is the Si570 or the programming circuitry.

Alan
Thanks for the the update.

Let me know when you have them in Stock.

Do you need to have some money donated to generate an inventory.
I would donate $10.00 to help give you a pool of funds to get past this 6 week ordering issue. I'm sure many in the group could do the same thing. Where you would have an inventory on hand.
I personally can't do more then that but this may help you out.

Thanks
Dean

Thanks for the suggested help but at the moment it is unnecessary. The Si570s have arrived but I suffered a concurrent outage of my master computer and it cost me another week of down time.

It will likely be about three weeks before I can clear out the current orders.

1506. Si570 LVDS 10-810MHz 570BAB000107DG

Yahoo group: UHFSDR
Date: 2013-03-16 18:46:19 UTC
From: Dominic
Topic: 1506 Message: 1506

Hi,

I have a couple Si570 CMOS and LVDS versions the latter being 570BAB000107DG so I think this means they are 10-810MHz variants, OE High so need to and have a 10MHz startup frequency.

So not the 570ABA000514G LVPECL version

This means I think I have to:

Connect H2-2 to H2-1
Install R45 (100 ohm)
Install C59,C60 (.1uF)
Install R46,R48 (1K)
Install R47,R49 (3.3K)

I am probably going to be happy enough with HF, 6m and 4m (maybe 2m) so it doesn't have to be the 1400MHz variant.

Anyone see any issues using one of these in the UHFSDR?

Dom:
Should work OK. Those components were designed to match LVDS output
to LVPECL input.

1509. Data modes?

Yahoo group: UHFSDR
Date: 2013-03-18 09:20:14 UTC
From: wt4cm
Topic: 1509 Message: 1509

Is anyone using this UHFSDR for different data modes? I was reviewing the Part 97 rules yesterday and noticed that 56k is allowed on 220 and 440 MHz.

It seems that it should be possible to do a high speed GMSK modem in software. Has anyone done this already? Has anyone tried implementing any other digital modes with this unit?

Thanks,

Chuck

whats the bandwidth at 56K?

Will your soundcard deliver that information to the UHFSDR ?

This old hardware packet modem used MSK and is 70 KHz wide at 26 dB down (http://www.wa4dsy.net/56kb/56kpaper.html). GMSK should use less bandwidth.

If i understand correctly, with a soundcard sampling at 192kHz, a 96kHz wide signal is possible. That might be ambitious, though, so that's why I'm asking what's been done up to this point.

From: MIKE DURKIN
Topic: 1509 Message: 1512

im not aware of it .... but the only real problem i can think of is gain flatness for the sound source ....

and .... i m not sure if you must send in FM.

Im not sure many computers will be up to the task of sending 96Khz of I/Q of FM modulation, the math is abit more involved ...

at least that's what strikes me as such ....

I use my UHFSDR with ghpsdr3-alex(ubuntu) and i cant demodulate FM for some reason ...

I might have a I/Q phase error larger than what the program can handle(actually programed - i suspect that it could) .... others have commented on phase error and unknown why. though i do suspect its something to do with the relay's you might get and the configuration needed for said relays --- the kit can be built with .... ummm two different relays now. Was three but one has terible noise floor for some reason (going by memory(bad idea) .. and what some one else said) ...

Wish more programs would be re-writen to use quadature schems ... it would be great to use MixW directly rather needing one program to demodulate the I/Q stream and then another to demod the information of the packets.

So i say .. have at it !!!!! 48k baud is still better than 1.2K ....

Might you consider generating the signal completely in software. THe
Raspberry Pi generates spread spectrum output on its GPio bus 1mhz
---200mhz.
There are examples:
"Hi all,
I've just joined the group and thought you might be interested in the "bare
bones" WSPR transmitter I've been working on.
It uses the technique from
http://www.icrobotics.co.uk/wiki/index.php/Turning_the_Raspberry_Pi_Into_an_FM_Transmitter
to
produce a WSPR signal directly on either the 2200m band or the 630m
band
(frequencies over 1MHz won't work.)
The output is a square wave so it must be filtered before going to an
antenna. I've also not put code in to turn off the transmitter if Ctrl-C is
pressed yet.
If anyone's interested, the code is at
https://github.com/DanAnkers/WsprryPi
Dan MD1CLV

If you can get the desired bandwidth out of a sound card.

Subject: Re: [UHFSDR] Data modes?

Was that trying to install from the
repo or building it.

It's on my Ubuntu todo list.

I have it built and running on openSUSE. The last git version I
built was on 27th. Feb.

All,

I'm really excited to see such interest in this.

Right now I'm reading up trying to decide whether it would be easier to attack this from the RPi side and using filters (like this: http://www.wa4dsy.net/56kb/56kpaper.html) or to continue attempting to generate the signal entirely in software.

I think it might be easier to follow the hardware path, but it will be much less flexible than if I can accomplish it with software.

I think I'll start installing software to see what I can come up with.

Anyone else have thoughts or suggestions on the best way to proceed?

GMSK is one of many digital modes that is a form of FM, so if I understand things correctly, gain flatness is not required (low phase error is, however, and the higher the data rate, the more important it will become).

You are right that it is a lot of calculations. Maybe there is a way to simplify things. I guess I have more research to do there. Maybe the solution is lookup tables rather than calculations.

Does anyone else out there have experience demodulation FM on the UHFSDR? How did you handle the phase error problem?

Hi Dave and all,
Thanks for the reply and sorry I did not answer before but due to work commitments I was kept away from the shack.
I managed to get a hold of a Tektronics 2465B 400Mhz Scope and verified that yes the signal is square wave and more or less the values are there.
I would like to thank all that made the suggestions and last but not least you Dave for the explanation.
Thank again Guys
Mans. 9H1GB

From: MIKE DURKIN
Topic: 1509 Message: 1524

well ..you could use a card that has a audio codec like tlv320 and program the phase error out ...

The SDR2Go and ??? can do that ... but i don't think it is at this moment capable of outputting more than 2.8Khz -- its just the way its programmed at this time and they (AQRP) are not keen on giving out the code for the dsPic ...

Something like that wouldn't care about what the audio spectrum was .... just a block phase error correction and image rejection would be done by the dsPIC/tlv320 ... and the computer take care of the further demodulation if needed/wanted.

They also do not have any computer control at this time -- something that iv mentioned before.

The response was "that it says right on the board -- "look ma -- no computer"" --- which i think is a bit short sighted..

i do kinda wish there was something avaliable that was under 100$$

On 23/03/13 21:56, MIKE DURKIN wrote:

well ..you could use a card that has a audio
codec like tlv320 and program the phase error out ...

The SDR2Go and ??? can do that ... but i don't think it
is at this moment capable of outputting more than 2.8Khz
-- its just the way its programmed at this time and they
(AQRP) are not keen on giving out the code for the dsPic
...

Something like that wouldn't care about what the audio
spectrum was .... just a block phase error correction and
image rejection would be done by the dsPIC/tlv320 ... and
the computer take care of the further demodulation if
needed/wanted.

They also do not have any computer control at this time --
something that iv mentioned before.

The response was "that it says right on the board -- "look
ma -- no computer"" --- which i think is a bit short
sighted..

i do kinda wish there was something avaliable that was
under 100$$

Subject: [UHFSDR] Re: Data modes?

GMSK is one of many digital modes that is a form of FM, so if I understand things correctly, gain flatness is not required (low phase error is, however, and the higher the data rate, the more important it will become).

You are right that it is a lot of calculations. Maybe there is a way to simplify things. I guess I have more research to do there. Maybe the solution is lookup tables rather than calculations.

Does anyone else out there have experience demodulation FM on the UHFSDR? How did you handle the phase error problem?

1528. Receive IQ balance

Yahoo group: UHFSDR
Date: 2013-03-29 15:45:12 UTC
From: rhillard@...
Topic: 1528 Message: 1528

Hi,

I'm using the UHFSDR board to feed a SDR2GO board, and am having difficulties in getting a good receive IQ null; in fact I can't get a null at all.

I can insert a signal into the IQ receive port of my SDR2GO board from my IQGen program and get a nice null using the SDR2GO's balance controls. However it appears that either I don't have enough range on the SDR2GO's controls, or there's something wrong with the UHFSDR's IQ circuitry.

The combination of the UHFSDR and SDR2GO boards receives quite well, but I can't get rid of the image.

Has anyone else had this problem, or maybe have a suggestion as to how to correct the problem?

TNX Bob WA6UFQ

Bob:
Must be something not right in your I/Q generator section or the audio section. A solder joint perhaps or a short. Do you have equal output on both channels? Are the LO inputs to the mixers 90 degrees apart? I get 20 to 30 dB sideband rejection on 440 MHz with no null adjustment.

From: Hank
Topic: 1528 Message: 1531

Bob,

I was having the exact same problem with image rejection on my SDR2Go and traced it down to a bad channel on U10A/B the MC3307B Line in. One half of the unit was working and I was getting the I without the Q. I traced it down with an o-scope seeing the same input at the MC3307 on pins 3&5 but the output on pin 1 was not aplified as was on pin 7. Replacing the MC3307 fixed my problem.

Good luck and 73,

Hank - wz3hmt

1532. HMC482 output

Yahoo group: UHFSDR
Date: 2013-04-04 11:27:13 UTC
From: Sid Boyce
Topic: 1532 Message: 1532

Hi Dave,
I have just been reading operation.doc and it says a 100 ohm resistor needs to be placed between the output and ground to stop it oscillating.

The circuit diagram I have has only L1 and C16 connected to HMC482 pin3.

A previous attempt connecting a 20W PA caused some sort of feedback loop which killed the HMC482.

I am about to connect a 1W PA (needing 1mW input) through a 18dB attenuator so I guess I need to install the 100 ohm resistor at the output of the HMC482.

I had not seen this requirement previously.
73 ... Sid.

Sid:
During prototype, I found the oscillation when the HMC482 output was open during receive. The attenuator should provide the needed load if connected right after the HMC482 before the TR switch.

Thanks Dave,
I have the attenuator connected by coax directly to the input of the driver so the Input and output relays bypass the attenuator+driver on RX so the HMC482 would only be connected to the attenuator when the relays switch to TX.

Sounds like the 100 ohm is needed in that case.

Yes, you should install it in that case. I saw an oscillation around
570 MHz. Wiped out our local UHF TV translator reception!

Hi Sid,

For the peace of mind, if you need only 1mW output, replace the HMC by an ERA6 or even ERA3 which are advertized and are in fact unconditionally stable.

With some careful bending of their input and output terminals, ERA3 or ERA5 fit nicely on the board, but of course require adapting of the biasing resistors.

The 100ohm resistor distorts the response of any bandpass or lowpass filter at the antenna terminal of the UHFSDR unless you add a series resistor in front of C16 for compensation.

Hi Dave

Can you explain this a bit more, please - the HMC482 is not powered during receive, so how can it oscillate?
I have been using my UHFSDR for over a year and havn't knowingly experienced this problem. Like Sid, I hadn't read your note at the end of the operations document.

ps - thanks, Dave for a superb design - it has reinvigorated my amateur radio interest. Apart from occasional HF use with an old 20W PA I built over 20 years ago, my main setup is on the 4m amateur band with a 150W PA - I am using it in competitions very successfully with PowerSDR - now using the latest version with divide by 2 for home brew rigs (another thread!)

Tony

Topic: 1532 Message: 1540

The transmit driver is an HMC482 and it was during TX that it went into oscillation when connected directly to a 10W PA via a 10dB attenuator. I had a SWR meter and a dummy load connected to the PA and the whole thing took off.

When I went back to using the UHFSDR into the dummy load there was nothing more heard from the monitoring RX and the scope confirmed there was no RF output.

73 ... Sid.

1542. IQ unbalanced

Yahoo group: UHFSDR
Date: 2013-04-05 21:09:45 UTC
From: rhillard@...
Topic: 1542 Message: 1542

I am unable to get rid of the image during receive and xmit. I have tracked the IQ signals from the J2 port (IQ receive) all the way back to the U15 and U16 mixers, and have found the IQ amplitude relationship to be identical from start to finish.

In addition, there is a phase error on receive and xmit.

I have uploaded a photo to the WA6UFQ folder labled IQ Unbalanced. As you can see, the I amplitude is almost two centimeters lower than the Q amplitude.

Although not real obvious in the picture, the phase relationship between I and Q falls short of the required 90 degrees by a number of degrees.

I have not been able to determine whether the problem is a defective U15 mixer, or a problem with the resistor/capacitor interconnect between the Si570 and LO input to the mixer. I can cause the phase relationship to change by putting a finger on the resistor/capacitor components in the matching and attenuator networks between the Si570 and the mixers.

Anyone have any ideas or suggestions?

Bob WA6UFQ

1547. UHFSDR carrier leakage

Yahoo group: UHFSDR
Date: 2013-05-13 11:03:10 UTC
From: g.suggate
Topic: 1547 Message: 1547

My set-up is UHFSDR+USB2SDR+PowerSDR V1.19.20.3(USB2SDR). I use the kit on 70mhz and amplify the output to 150 watts and have received very good reports apart from a complaint of "audible carrier" on SSB and under key up on CW. I have checked at the output of the UHFSDR and the signal is there. Too low for my instruments to measure, however when fed to the amplifier it produces measurable o/p. I have checked it on other frequencies and it is still present. It seems to be about 300hz away from the intended frequency. I note the signal is present even with the drive on the PowerSDR turned down to zero.

Can anyone tell me if this is normal or should I start digging inside the UHFSDR for a faulty component?

Best regards and 73

Geoff G3NPI Buckingham UK

disconnect the audio lines for Tx from the uhfsdr ... then hit the Tx ....

You should not see a carrier ... least not on the freq that the VFO is set to (Si570) ...

I would think its an audio product from the sound source ... or Tx balance/phase settings.

I had the same problem with the USB2SDR but much farther away from the FOI.
Turned out to be the op amp driving the line was oscillating.

1551. Re: UHFSDR carrier leakage

Yahoo group: UHFSDR
Date: 2013-05-13 23:02:13 UTC
From: rainerfeldkamp
Topic: 1547 Message: 1551

Dave and Geoff:

The isolation level of the ADE_2ASK is of no help if one of the two mixer paths has a problem which I would check in first instance.

A further possible cause for carrier leak is the source for the 5V at P2-1 on transmit. If the 5V are taken from TP1-1 as proposed for testing, there is a very looong line to P2_1 picking up a lot of noise.

I was able to further narrow down the anyhow excellent output spectrum in the below -60dB region by placing a DPDT micro relais directly besides P2 and taking the 5V from the terminal of C72 at the edge of the board. Perhaps P2 could be supplemented by a third (5V) pin in the future.

The relais is operated in the usual manner from the PTT output of a ATINY 85 USB/I2C converter, and the second contact set of the relais is used for operating the PA and antenna switching thereof.

Topic: 1553 Message: 1553

Hello Alan,

Can't reach you by email during last week. Probably emails go to spam/junk folder.

The question is about kit availability - any ideas/expectations about possible date get ordered?

Thank you for your reply in advance.

Regards,
Andy - YL2QN.

1554. soldering d1

Yahoo group: UHFSDR
Date: 2013-05-20 03:54:41 UTC
From: Ronald Wagner
Topic: 1554 Message: 1554

I've just gotten to the step of soldering down D1, which is by far the most challenging chip I've ever had to tack down.

I'm thinking of doing a forward/reverse check with an ohm meter on the pad of Q7 pin2 since it's not there yet. But is there any danger to D1 in doing that?

Ron

Yahoo group: UHFSDR
Date: 2013-05-20 09:44:25 UTC
From: Sid Boyce
Topic: 1554 Message: 1555

After my first UHFSDR build I submitted a post saying that on a subsequent build I would install D1 as the very first component.

On my second build and considering the checks to be made, that was not possible.

The best approach would be not to install P4 until after D1 has been installed.
The tests that need P4 could be performed using wires that would fit the holes.

I tried using the footer for that but found it not easy to get the pins to make contact.

1556. Image null and carrier suppression

Yahoo group: UHFSDR
Date: 2013-05-24 17:29:07 UTC
From: rhillard@...
Topic: 1556 Message: 1556

I am having problems with both the nulling of the image and suppression of the carrier.

I've corrected the nulling problem by adding gain control pots to U9 and U10, which allowed me to null receive and xmit images.

However I still have a carrier suppression problem.

Looking a little closer at the clock circuitry between the Si570 and the mixers, I found that the output levels of the two flip flops don't match. The output level of U17, the I flip flop is 25% lower in level than U18's output level. This level variance carries all the way to and through the two mixers.

I'm looking for opinions on this. Has anyone else had this problem? Should I try swapping out the flip flops? What is the availability of these chips?

Thanks,

Bob WA6UFQ

1557. RE: [UHFSDR] Image null and carrier suppression

Yahoo group: UHFSDR

From: MIKE DURKIN
Topic: 1556 Message: 1557

I would swap'em ... if it dosent follow the flip/flop -- then you have an incorrect value resistor in the impedance matching line to the mixers ..

the parts are available .... all over the place ...

I have 2 UHFSDR's ... one has a odd phase error problem ... its not real bad ... but measurable.

adding gain control pots to U9 and U10 only solves the issue of gain of the opamps .. but its not the problem.

Fix the level issues of the source to the mixers first ... what ever that may be, and you should find that you can remove your mods.

Carrier suppression problems are direct result of imbalance going to one or both mixers from the flip/flop ... this is a voltage imbalance, not phase -- unless you have a darn good scope, your not going to be able to measure the phase error.

the I/In and Q/Qn levels should be the same .... and I / Q should also be the same ..... (n=not) .... at the mixers -- i dont remember closer to the flip/flops ....

Also what Si570 are you using -- LVDS or ??

Topic: 1556 Message: 1558

Bob:
Carrier suppression is a function of the mixers. The flip flop outputs should be identical in voltage level. Either their loads are radically different or one is bad. Check the resisters and solder joints between the flip flops and the mixers. Also, make sure you have the right resisters installed for the type of Si570 you are using. Until recently, the schematic showed the values for LVDS and indicated in a table the changes for LVPECL. I recently changed the schematic to show the LVPECL values since the Si570's included in the kits are LVPECL. With no tweeking in the program, I get 20 - 30 dB of opposite sideband rejection and I can't see the carrier at 440 MHz.

1559. build problem; step 199 TR RF Switching

Yahoo group: UHFSDR
Date: 2013-06-10 02:54:21 UTC
From: Ronald Wagner
Topic: 1559 Message: 1559

I'm getting some disagreement with the build instructions for testing the T/R RF switching.

Step 199 & 200 sat that U7 6 and 4 should be 0 and 5v respectively, but I'm getting the opposite. Can anyone make some suggestions?

On U6 I see the following pin voltages:

1 5v

2 5

3 0

4 0

5 5

6 5

7 -

8 0

9 5

10 5

11 5 - which goes to U2 which is correct voltage

12 5

13 0 - which goes to U2 which is ok

I have H5 2 and 3 shorted.

It actually looks like the U7 voltages are what they should be, but that's counter to the build instructions.

Hi Dave,

I've corrected my sideband null problem, replacing R46 -R49 with the correct resistors (values supplied were in error).

However I am still not able to null the carrier; it is only around 16db down. I've tried varying the value of R31 and R33 using miniature SMD trimmers, with no success.

Any ideas on what could be causing the carrier level to be high?

Any chance that I might have a defective mixer installed?

Yahoo group: UHFSDR
Date: 2013-07-10 19:37:27 UTC
From: Dave
Topic: 1556 Message: 1562

Bob:
Sideband suppression depends on both phase accuracy and the amplitude of both channels being matched. If you can look at higher frequency bands, if the suppression goes down with increasing frequency, the the problem is most likely phase error. If it is about the same, the amplitude matching at audio is likely the problem. It could also be a mismatch in gain in the two channels of your soundcard. But, the SDR software should be able to take care of the mismatch you have.
R22/R19 and R21/R18 determine the audio gain in the I and Q channels.

From: rhillard@...
Topic: 1556 Message: 1563

Hi Dave,

My sideband suppression has been resolved. It's the carrier suppression that I'm struggling with now.

Any suggestions on what might be the problem?

Have there been any instances of a defective mixer causing the carrier to leak through?

Bob

Bob,

A fine carrier in the centre of the display is due to a DC offset in the I and Q, this is not a big issue, the software can sort this out with ease. What you do is computer the average I and average Q over a period of time - say 10 seconds - then subtract this from all future I and Q values read from the radio. Myself I always update the computed values.

Let me know if I can help further.

Simon GD4ELI/HB9DRV

Mike:
Should work if it is in the ssop16 package. IDT has discontinued the 74FST3257Q and I couldn't find a datasheet. The FST3257 is available from Mouser, P/N 512-FST3257MX for $0.65 each.

Hi Alan

Could it be possible for you to send me a couple of SY10ep52 (U17-U18) too ? Those delivered with one of the kit were TSSOP devices (far smaller than SOIC). This kit has been ordered more than one or two years ago, and I just assembled it 2 weeks ago.

This is for my □spare□ UHFSDR, so it□s definitely not urgent. Just tell me if you have some of these IC□s in stock and how much will it cost for DX shipping.

I can do that but understand that I haven't changed those parts since I started shipping the kits. They are size SO8N. Also, they are expensive in comparison to the other components excepting the si570.

73,
Alan - W6ARH

Marc,
If you want the ones I currently ship (there have been no comments on
size from the hundreds of kit builders) I think $15 USD would be sufficient.

Hi Alan

It's definitely MY fault, not yours. I let this kit aside during almost 2 years, and don't remember if had to cannibalize some stuff and replaced it with a wrong value. That☐s probably what appends. Local dealer seems to only have TSSOP package. I keep on searching and will bug you only if I cannot succeed. In this case, I'll send you a paypal order and an direct confirmation mail . The most important info is : you have it in stock, my spare UHFSDR will be alive some day :- DD
Thank you again Alan

1576. Carrier supression

Yahoo group: UHFSDR
Date: 2013-07-25 15:16:17 UTC
From: rhillard@...
Topic: 1576 Message: 1576

I'm still working on improving the carrier supression. I can only get around 16dB of supression. I've changed out the mixers (didn't fix the problem), and have tried adjusting the LO level into the mixers (no help here either).

Last night I found that there is a difference between the DC level on pin #2 of the mixers. U15 has 3.4mv, and U16 has 1.6mv on pin #2. This DC voltage level apparently is a function of the LO level. Higher LO level results in a lower DC level apparently generated by the mixer's diodes. I can vary the DC voltage by reducing the LO level (finger on the resistors in the attenuators feeding the mixers).

So unless the mixers aren't match very well; (one mixer creating more DC than the other one), the difference in DC levels between the two mixers, appears to be an indication that the LO drive levels to the two mixers aren't equal.

It would be helpful for me to know what voltage others are getting on pin #2 of their mixers.Also it would be helpful to know how much carrier rejection others are getting.

Subject: [UHFSDR] Carrier supression

I'm still working on improving the carrier supression. I can only get around 16dB of supression. I've changed out the mixers (didn't fix the problem), and have tried adjusting the LO level into the mixers (no help here either).

Last night I found that there is a difference between the DC level on pin #2 of the mixers. U15 has 3.4mv, and U16 has 1.6mv on pin #2. This DC voltage level apparently is a function of the LO level. Higher LO level results in a lower DC level apparently generated by the mixer's diodes. I can vary the DC voltage by reducing the LO level (finger on the resistors in the attenuators feeding the mixers).

So unless the mixers aren't match very well; (one mixer creating more DC than the other one), the difference in DC levels between the two mixers, appears to be an indication that the LO drive levels to the two mixers aren't equal.

It would be helpful for me to know what voltage others are getting on pin #2 of their mixers.Also it would be helpful to know how much carrier rejection others are getting.

Mike,

It's DC on pin #2. I went back and read my notes; DC voltage appears to track LO level (LO level increase = voltage increase on pin #2, not as originally stated)

50+dB of suppression is what I'd like to achieve.

Mike:
How are you measuring LO suppression? If your using an SDR program
and looking at the center spike, a slight DC offset on the computer ADC
will cause a spike there. Looking at it on another receiver would be
better.
The LO is fed differientially. Check that the resistance from pin 6
of the dbm to C65/R29 is the same as from pin 1 of the DBM to C66/R29.
Neither pin 1 nor pin 6 are grounded. Also on U16 and R30.

HI Dave,

Let me answer your question about How I'm measuring the carrier suppression -

I'm measuring it two ways:

1. Bird wattmeter on the output of the transceiver/transverter; 40w peak, 1w carrier - 16dB on 1296. Similar ratio on all three bands - 432, 902 and 1296.

2. Visually on my SDR dongle with the AGC disabled, no center spike.

The resistance check across the attenuators measured 8.7 ohms on both legs.

From: Dave Miller
Topic: 1585 Message: 1585

Making good progress on my Kit.
Seem to have run into a snag at step 167.
I am using to Sig generator to test out the RX side.
What level of RF signal do you need?
Why do you have to connect H1 to computer?
It looks like the Si570 powers up defaulted to 20MHZ
Set generator to 20.010. Correct?
See signals through mixer but not past series inductors.
Any ideas.
Thanks
Dave

Dave:
Just about to go out to the wood working shop to do some work, so will have to check the assembly instructions later.
H1 is the control for the Si570. It goes to the ADum1251 which provides isolation and level shifting, if needed. The input requires, in addition to the I2c clock and data signals, a reference voltage and ground.
If you got the kit from Alan, the Si570 should default to 19.982 MHz. That is so that when you run SDR-IQ with a 9 KHz offset, it will tune 10 MHz WWV. So, LO to the mixers will be 9991 KHz.

Thanks, Dave
Works now with a right frequency. Also might have had a poor connector on
tacked on antenna connector.
Enjoy making dust not smoke. ;-)

It's only software. ;-) I expect it will do these modes sooner than later.
It's open source software and will be possible to add these extra modes.
The software is being written so its straight forward to add screens and new modes. That is the power of SDR.
Once boards get in the hands of users I expect things like that may happen quickly.

Mike it's on my wish list.

Thanks for good question. So much to do so little time.

Very nice project Dave

Some questions :-) (you know how Hams are)

- do you intend to sell a real "kit"? I mean many Hams around here, and particularly in the UHFSDR or SDR-Widget SDR community, fell absolutely confident soldering QFPN144 IC's. They really don't need pre-chewed home brewing.
-What is the usable bandwidth ? (192k said the TLV320AIC3204 datasheet but...)
- did you consider developing a firmware able to deal with AT050TN33? this kind of 5" TFT's are widely used in the Ham community (Pic-A-Star for example), are at the very same price, sometime lower, than the 3" screen you use, and a bit wider for guys like me who have "big fingers" :-/
- could it be possible to only use the Si570/display unit and "disengage" the signal processing clutch (for people using a better audio processor)

Thnks for your efforts and developpement
73'

How are you defining Wideband? The FCC definition (200
kHz BW) or the Wide Land Mobile definition (16 kHz BW)?

MCH:
200 KHz as in broadcast FM. My comments were my experiences with PowerSDR-IQ and the UHFSDR. Max bandwidth depends on the A/D sample speed, the software, and any filters. The UHFSDR has a 50 KHz filter in each channel, limiting bandwidth to 100 KHz. The filter could, of course, be re-deisgned for higher frequency. The $20 SDR dongles were designed for digital TV and with SDR# have no problem with broadcast FM.

thats cool .. didint know you had a STM32-SDR ...

now im really interested ... to replace my SDR2GO !!!!

Mike:

I've used it on 2 meters and 70cm NBFM. I have also used it to
receive AM(never tried transmitting). Depends on the software.
Will not do wideband FM.

Subject: [UHFSDR] STM32-SDR now has a website.

Please excuse the intrusion.
I want to tell you about a project that I and a
group from AQRP (Austin TX QRP) have been working
on. I am just finishing up my UHDSDR kit and it
should play nicely with the UHFSDR.

STM32-SDR (SDR Sans PC) the project that replaces
the PC when hooked up to a I/Q based RF deck has a
website now. This project is a open source
software with a hardware board available. The
UHFSDR was taken into account when it was
designed.

More information on the project with pictures and
documentation can be found at

www.stm32-sdr.com

Drop by and get more details.

If you have interest make sure you also drop an email to stm32sdr@...
to get on the email updates list for more up to date information.

Thanks for you interest.

This is a very cool project.
I had a couple of questions:

Is there enough cpu power to do digital modes as well? PSK31, RTTY, SSTV, Packet, maybe more obscure?
If not, would it be hard to add a second board for those?
Have you seen the HackRF project on kickstarter? That might be another community that these would be good for.

Marc,
Thanks for your interest.
Questions are always good.
The initial focus is to provide the hardware and software support to the largest group of people. So this means some decisions have been made on what we are doing both on the hardware and software side.

In the short term the kits will be a semi kit meaning the SMT parts will be installed. I have in my plans an option offering the bare board only with no parts. But this is not first thing to get done. I believe that offering a bare board and a bag of parts may be possible but not in my short term plans. Shipping SMT parts in a bag is going to be costly when the extra packaging and handling is factored in. I agree there are many people out there capable of working from a bare board. I do it all the time. Our goal shared with the group involved has been to provide the best experience to the people wanting to work with our project. We also are attempting to do this at the lowest possible cost. The feedback I have to date even from a few hard core always build from scratch types has been positive with the semi kit.

Software is what makes SDR tick, providing an easily accessible hardware platform to support the software effort is the focus of this project. The number of people that can hand solder fine pitch SMT and write advanced DSP is small. The group that either have the software skills or want to learn more about the software side is I believe a large group. That's is what this project is about.

You also could consider if you want to solder the parts on we will provide you that opportunity with our innovative packaging and labelling technique. It will involving de soldering the parts first, organizing them then reinstalling.

The feedback to date I have received and I am keeping track is 90% are happy with semi kit and 10% want to solder SMT parts on. If you have not yet drop an email to stm32sdr@... with your interest and desire for bare board and no parts or a bare board and a bag of parts. Once I fully understand the demand I will prioritize the response.

The bandwidth is a function of the hardware and the software.
The codec ADC and DAC both support 192 KHz rate.
I believe the Processor is capable of reading data at that rate.
The question will be can the processor do all the FFT's and other processing in time and keep up.
The processor in the early benchmarks proved to be much more powerful than the DSPic's.
The current focus on the software side is to get a baseline of functionality completed and tested. The amount of effort to accomplish this cannot be understated. It is coming along nicely but by no means complete but has progressed to the point that "basic DSP and functionality" has been obtained to to the point that on air QSO's have been made by myself and others in the development team. Does this mean that its ready for general consumption and that its at the same class as a commercial radio. NOPE. Every day things are moving ahead.

With our focus on basic functionality we are currently working with an 8 kHz sample rate. This decision is based on its adequate for our purposes right now. Once we reach our first goal of a stable useable software platform I would vote for cranking up the sample rate to see what we can accomplish. Don't forget this is a Open source software project, once you get or build a board and compile the software you can test the limits yourself. I have not done the benchmarks myself , And don't have the current results at hand but its all about how much time we have between interrupts to process and do screen updates. There is lots to do and in many ways the hardware is waiting for the software to catch up. The development of the graphics support has been the main focus recently and getting that framework working, tested and integrated is nearing completion. Once that is completed back on to adding functionality.

Please remember this is not a full time project for anyone. The developers are doing this when time and energy permits. Some are retired with busy lives, others are fitting it around other commitments. Supporting the project by buying boards when available or contributing to the software or testing will move this project ahead. If it becomes wildly popular it is possible it could support some full time programming effort.

I am not familiar with the display you mentioned. This display was chosen based on price, functionality and availability. If your display happens to have a common interface it is theoretically possible to support it. You would have to re write the graphics support low level stuff. Just had a look. It's a RGB interface. The display we use has a built in touch screen and LCD controller. Different animal. I don't see it happening on this board. I would love to have a larger display. Given a compatible hardware interface anything is possible. It's Open Source Software.

Marc,
As I have mentioned many times the software is open source. The hardware connections (schematic) is on the website. If you have the skills to modify the software to your requirements you can do it.
If not you will have to find someone to do it. You can modify the code to do what ever you want the hardware pins to do.
So what do you consider better audio processor?
I expect there could be another generation of board and I like doing boards so let me know your wish list. I will look at it.

Dropping me a note directly will allow us to explore your other requirements.
Thanks Marc and I welcome the questions.

Hi Dave

A big thank you for this detailed answer. Be sure that I fully understand your motivations, constraints and goals, and I hope you didn't take my question for a "negative criticism". All of them where really "candid interrogations". You definitely made a wonderful project.

You're right. Kitting such a project is a really heavy job. A simple bare pcb will be fare enough for people with abnormal demand/needs/brain.

… and your answer could be definitely added to the FAQ section of your website, to avoid other stupid questions like mine.

Tnks again for your precisions

73'

Marc

PS : "better audio processor" here is a couple of SDR-Widget and an Asus sound card that gives very surprising good results. But I was only considering the performance of the board, not the "look Ma, no computer" aspect of your project

No offense taken, I enjoy good discussion.
I will look at adding your questions to the FAQ.
I don't think anyone has claimed the codec chosen was the best one out there. Once the dust settles and there is someone willing to support the software side I will gladly consider another board or two. I had another codec picked but existing software support end experience dictates this one.
Looking at the SDR-Widget there are pluses and minus. I see the ADC is single stereo channel. So we would need two, Did not check the DAC, I suspect we would need two. more parts, bigger board more cost.

Low power and small footprint were several of our design goals.
I still stand by as a transceiver you will have much better results if you dont use USB to move audio back and forth and divorce yourself from an OS.

Time will prove me right or wrong. ;-)

James,
Thanks.
If you have a chance to look at the You tube video you will see its already does PSK 31 transceive. No reason why it can't do all the other modes. BTW Milt of NUE modem fame is part of the team. His code was the basis of the PSK. It's an issue of software. I will be glad to check in code for your other modes. I am confident there is enough performance for those modes. software is being crafted in a way that enhancements like this will be possible. But it won't be in the first public release for sure. ;-)
Remember the code is open source. You can add this functionality. Its only software ;-)

I have not looked at HackRF.
To be honest its hard enough for me to stay focused on getting this project out the door and into production. For others who have done this they understand all the things to do. I am not delegating things just doing it myself. I will have a look when I get next run of boards into production .

Thanks for you interest.

From: Marc OLANIE
Topic: 1591 Message: 1607

Hi Dave

>Low power and small footprint were several of our design goals.

That's definitely a killer argument. One could argue about the difference between a software define radio and a "firmware" defined radio (limited by definition by the size of the processor), but for field days and people looking for a "one box rig", SDR2GO and it's evolution is the only elegant way.

>I still stand by as a transceiver you will have much better results if you dont use USB to move audio back and forth and divorce yourself from an OS.

That's sounds logical. But no OS means no way to deal with a multitude of modulation schemes too. In another way, we are seeing more and more small footprint CPU board (Odroid X2 and other "über-raspberry" mobo). The difference between a rig with a mobo with a portable/embedded OS and software and a full featured firmware-base tranceiver is less important in terms of performance but non in terms of functionality. Working with SDR is a tradeoff. You'll ever have to choose between flexibility, funtioality and portability.

Every ham dreams of a small portable SDR with all the possible modulation/demodulation possibilities and the widest bandwidth displayed on the screen :-D .

>Time will prove me right or wrong. ;-)

I'm pretty sure you're right. The STM32 is a "keep it simple" solution (and universal if you're able to deal with "by 2" and " by 4" clock ratio, as advertised). Hop you'll quickly add NBFM . I've a UHFSDR waiting for it :-D

No worries. I am having fun. Just must stay focused. ;-) Much better than having nothing to do. Especially with the great HF propagation these days.
It's so rewarding to get any interest. The group has been putting in many hours to get it where it is. It has lots of possibilities. Everyone is hoping for interest to grow.
From my experience getting the baby delivered is lots of hard work.
Thanks
Dave

One could argue about the difference between a software define radio and a “firmware” defined radio (limited by definition by the size of the processor), but for field days and people looking for a “one box rig”, SDR2GO and it’s evolution is the only elegant way.
>I still stand by as a transceiver you will have much better results if you dont use USB to move audio back and forth and divorce yourself from an OS. That’s sounds logical. But no OS means no way to deal with a multitude of modulation schemes too. In another way, we are seeing more and more small footprint CPU board (Odroid X2 and other “über-raspberry” mobo). The difference between a rig with a mobo with a portable/embedded OS and software and a full featured firmware-base tranceiver is less important in terms of performance but non in terms of functionality. Working with SDR is a tradeoff. You’ll ever have to choose between flexibility, funtioality and portability. Every ham dreams of a small portable SDR with all the possible modulation/demodulation possibilities and the widest bandwidth displayed on the screen :-D .
>Time will prove me right or wrong. ;-) I’m pretty sure you’re right. The STM32 is a “keep it simple” solution (and universal if you’re able to deal with “by 2” and “ by 4” clock ratio, as advertised). Hop you’ll quickly add NBFM . I’ve a UHFSDR waiting for it :-D73’++Marc f6itu

I think your right Dave .... until USB3 is supported fully in windows ... embedded systems and Ubuntu are in the forfront workability for SDR software.

No offense taken, I enjoy good discussion.
I will look at adding your questions to the FAQ.
I don't think anyone has claimed the codec chosen was the best one out there. Once the dust settles and there is someone willing to support the software side I will gladly consider another board or two. I had another codec picked but existing software support end experience dictates this one.

Looking at the SDR-Widget there are pluses and minus. I see the ADC is single stereo channel. So we would need two, Did not check the DAC, I suspect we would need two. more parts, bigger board more cost.

Low power and small footprint were several of our design goals.

I still stand by as a transceiver you will have much better results if you dont use USB to move audio back and forth and divorce yourself from an OS.
Time will prove me right or wrong. ;-)

Dave

On Tue, Aug 6, 2013 at 8:48 AM, Marc OLANIE <Marc.olanie@decision.fr> wrote:

Hi DaveA big thank you for this detailed answer. Be sure that I fully understand your motivations, constraints and goals, and I hope you didn’t take my question for a “negative criticism”. All of them where really “candid interrogations”. You definitely made a wonderful project.
You’re right. Kitting such a project is a really heavy job. A simple bare pcb will be fare enough for people with abnormal demand/needs/brain.
… and your answer could be definitely added to the FAQ section of your website, to avoid other stupid questions like mine.
Tnks again for your precisions73’
Marc
PS : “better audio processor” here is a couple of SDR-Widget and an Asus sound card that gives very surprising good results. But I was only considering the performance of the board, not the “look Ma, no computer” aspect of your project

Not necessarily needing mainstream Ubuntu, the real problem is the max98090 problems are not being addressed and I see no direction to their kernel development since they fixed the mali400 driver.

mdrjr's last statement to my request was that the mainline kernel's max98090 support doesn't support HDMI audio.

Having HDMI audio support is as useless as a three speed dish cloth, in cases where it works, you get extremely tinny audio and worse still with some SDR software, e.g quisk, you get pulsating audio from the speakers accompanied by extremely loud pulsating white noise from the HDMI.

Substituting a USB sound card, it's fine.

The ODROID max98090 support does not lend itself to be useful for I-Q either.
73 ... Sid.

Marc,
It supports the x2 x4 already. I will try to get my UHFSDR up and running this week and post a video. Only need a couple of hours to finish it. I believe one of the other people on the team as a UHFSDR hooked up. I am only claiming something after I have done it myself.

NBFM is high on my list to do. Getting boards in others hands and writing documentation is keeping me off the streets right now ;-)

Thanks for interest.

Hi, great news Dave, I have two UHFSDR board's one of them is connect to SDR2GO
which by the way works very well but only have SSB/CW, so the NBFM it is welcome.

waiting for your new video :) ...

Topic: 1617 Message: 1617

i am stuck at Step 199. I have read the discussions but not seeing a clear answer.

I have AS169, I know that because I put new ones in and they are marked S169.

I am getting in Step 199 U7-6 as 5V Step 200 0V
Step 203 no continuity. Step 204 continuity.
I have H5 jumpers 2-3.
This seems to be conflicting with the directions.

If this correct and should I move on or is there an problem?

I saw in one message a comment that there are error in the assembly manual. But not details.

Any help is appreciated.
I am expecting I should just continue.
Thanks
Dave

If the circuit is using the AS169 instead of HMC544 for U7 the logic driving it is the same.

With H5 2->3 and grounding P2-1
U6A pin 3 puts a Low on U7-4 and U6B puts a High on U7-6 so that looks perfectly OK and logical.

I never checked the continuity.

There has been a lot of confusion around this part of the circuit, some have said it's OK by leaving off H5 jumpers.

My tale of woe lasted around 8 months and 2 kits.
I was shipped AS157's with an early kit from Art and also with a second kit from Alan (no doubt stock from Art's handover).
I kept replacing AS157's only to discover eventually that the datasheet and the Assembly Manual which suggests it's the same as the AS169 is totally wrong.

I ordered some AS169's and AS157's. When around 3 or 4 AS157's failed to work as expected I installed the AS169's and everything worked on both UHFSDR's.

The circuit diagram could do with a change for the AS169 - A is pin 4, B is pin 6, RF1 is pin 1 and RF 2 is pin 3 and H5 jumpering takes care of the differences.
73 ... Sid.

I can check back in my mail but as I remember you got some stock from Art - definitely the first order from ART came with AS157's, the one from your good self also had AS157's.

They were labelled as AS157's and both UHFSDR's caused me many months of grief. Strapping H5 one way, they would only work in RX, the other way only in TX.

I had no AS169's at all before I ordered some and installing them made both UHFSDR's work in RX and TX.

1623. Help! si570 programming problem??

Yahoo group: UHFSDR
Date: 2013-08-31 23:19:49 UTC
From: Ronald Wagner
Topic: 1623 Message: 1623

Hi all,

I'm having some problem with the output of the si570. It seems that programming the device for below about 5MHz works fine. But setting it for higher frequencies doesn't quite work, unless I do a power cycle on the 12V supply. Yet CFGSR shows the right frequency every time.

If I look at the output (TP8 or TP9), low frequency settings (say 2.5MHz) show a rough square wave (some ringing). Setting it to say 10MHz the signal at the test points look more like rough sine waves at 2-3 times the appropriate frequency. But if I turn off the 12V supply (leaving the USB connected) and then turn it back on, that sine wave becomes a square wave and at the correct frequency.

I'm using a USB2I2C to connect the computer USB to the UHFSDR. (http://www.wb5rvz.com/sdr/usb_i2c/index.htm) One thing concerns me about this and it's the Vdd connection on the UHFSDR board. For H1-pin1, I tied this to the Vcc of the UHFSDR, which is the +5 coming from the USB. I connected this to the "red dot" side of R5 (see schematic on idex page above). Maybe I should have gone to the other side of R5 (i.e. CW KEY_1)??

I also think the 7805 on the UHFSDR gets warmer than I would expect. I put a heat sink on it and it's still hot.

Summary:

- CFGSR always reports correct frequency

- frequencies < 5MHz-ish seem to work OK

- frequencies above 5MHz require a 12V power cycle to kick start the si570

Any thoughts on how to resolve this?

Ron

Ronald:
H1 pin 1 should NOT be tied to the VCC of the UHFSDR. It should only be tied to the 5V from the USB2I2C. H1 pin 2 should be tied to the ground on the USB2I2C.
The 7805 does run very warm, especially with 12V applied. The ADuM1251 isolates the USB power from the UHFSDR power and ground. It will also convert voltages of the I2C(in this case from 5V to 3.3V).

From: Ronald Wagner
Topic: 1623 Message: 1625

Sorry Dave, that was a typo on my part. I have H1-1 connected to Vcc of the USB2I2C, which is the 5V from the USB. And H1-2 is connected to ground on the USBI2C, as you say. So my USB2I2C connections to the UHFSDR are OK.

Any guesses on what my problem might be?

On 8/31/2013 4:19 PM, Ronald Wagner wrote:

Hi all,

I'm having some problem with the output of the si570. It seems that programming the device for below about 5MHz works fine. But setting it for higher frequencies doesn't quite work, unless I do a power cycle on the 12V supply. Yet CFGSR shows the right frequency every time.

If I look at the output (TP8 or TP9), low frequency settings (say 2.5MHz) show a rough square wave (some ringing). Setting it to say 10MHz the signal at the test points look more like rough sine waves at 2-3 times the appropriate frequency. But if I turn off the 12V supply (leaving the USB connected) and then turn it back on, that sine wave becomes a square wave and at the correct frequency.

I'm using a USB2I2C to connect the computer USB to the UHFSDR. (http://www.wb5rvz.com/sdr/usb_i2c/index.htm) One thing concerns me about this and it's the Vdd connection on the UHFSDR board. For H1-pin1, I tied this to the Vcc of the UHFSDR, which is the +5 coming from the USB. I connected this to the "red dot" side of R5 (see schematic on idex page above). Maybe I should have gone to the other side of R5 (i.e. CW KEY_1)??

I also think the 7805 on the UHFSDR gets warmer than I would expect. I put a heat sink on it and it's still hot.

Summary:

- CFGSR always reports correct frequency

- frequencies < 5MHz-ish seem to work OK

- frequencies above 5MHz require a 12V power cycle to kick start the si570

Any thoughts on how to resolve this?

Ron

From: Sergio Lopez Llorens
Topic: 1626 Message: 1626

I'm new to the group and now building uhfsdr.
I want to use it first for vhf uhf sats then I wonder if there is some aplifier for 50 mW in and some watts out (around 50 watts will be enought)
What about the filters? I'm thinkin in use a v/uhf diplexer...

Your experiences are wellcome... How do you usually work sats with uhfsdr?

Thanks a lot.

Hi Sergio,
I tried using a 10W HF PA from an old rig that required 1mW input.
I fed it through an attenuator box but it went into oscillation and TX died.
I replaced the HMC482 but still no output and I haven't got around to
looking at it again.

The hope was to use it to drive the 1mW in, 1W out driver I got from
www.funkamateur.de -- document only in Deutsch but key points not
difficult to figure, main ones FT23-43 10 turns bifilar and bias settings.

Ben (NO5K) on the AQRP group posted some tips on his UHFSDR2GO which he
used in a VHF/UHF contest but there was no mention of filters,
amplifiers, etc.

I have only used mine with the SDR-Widget and HF RX/TX BPF's.
73 ... Sid.

Hi!
As far as the PA is concerned the easiest way to get 50W at V/U is to use
the ra60h1317m and ra60h4047m1 Mitsubishi modules.

From: <tabbey01@...>
Topic: 1626 Message: 1629

Hi Sergio

I am using my UHFSDR for the full legal power in the UK on 70MHz (150W). For the driver I use a home-brew PA RD30HVF1 Mosfet with 12V supply which is capable of 15W o/p but needs a bit more drive for that than the UHFSDR can provide, so its very conservatively rated and is probably running at about 5 W. This then feeds a MRF151 PA bought from an eBay store - (fmbroadcasters) which runs from 50V and produces 150W on 4m into one of his high power band pass filter/SWR shutdown circuits. I mounted the PA and filter on a massive heatsink with an N type connector at the o/p. Its fed by a 48V 7A switch mode power supply I bought faulty on eBay and repaired.
I have brought the 8V tx switched power out of the UHFSDR to feed an antenna changeover relay and bias for the PA and driver. I am working my way up the 4 meter contest listings with this set up.
Hope this helps to show what you can do with the UHFSDR.
73s
Tony

Dave,

They look correct-- footprint is correct, looks like my other working unit and the pics in the build guide. I am wondering if I got something other than 4401s. I looked at the packaging from Digi-key and It says mmbt44011lt1g -- the units are marked "mv." I have an order in for more 4401's so I can swap them out next week to see if thats the issue, I use a hot air gun for soldering and have successfully built many smd projects with the technique, but I wonder if I've somehow destroyed these transistors. Thanks for the help -- I'll let you know how the swap works.

Dave,

Traded out the Q1-4 and Q6 transistors(?) from the original assembly with new ones and those circuits now seem normal. I am not sure what Digikey sent me the first time -- the "mv" markings did not agree with On Semiconductor data sheet -- new transistor markings do agree. I did communicate win Digikey about the issue but haven't heard back. Anyway, I'll finish testing and hope nothing else rears up. I am hoping to use this unit with an STM32SDR when the boards become available. Thanks.

Dave,

They look correct-- footprint is correct, looks like my other working unit and the pics in the build guide. I am wondering if I got something other than 4401s. I looked at the packaging from Digi-key and It says mmbt44011lt1g -- the units are marked "mv." I have an order in for more 4401's so I can swap them out next week to see if thats the issue, I use a hot air gun for soldering and have successfully built many smd projects with the technique, but I wonder if I've somehow destroyed these transistors. Thanks for the help -- I'll let you know how the swap works.

1645. Announcement: USB2SDR & HPADC on Indiegogo

Yahoo group: UHFSDR
Date: 2013-10-28 08:20:52 UTC
From: <sv1eia@...>
Topic: 1645 Message: 1645

Hi,

It has been quite some time since the previous USB2SDR offering, yet the demand from users is still going on. And that demand and user interest makes me to take this initiative.

Due to local reasons, considering the difficult situation here in Greece, any thoughts on moving on with a new batch of boards were suppressed.

That has changed and the reason for this is the relevant new concept of crowdfunding, that concept can be used here and assist all of us.

So I decided to start a campaign on Indiegogo, one of the most reputable crowdfunding sites.

Thus, any of you want to have a new USB2SDR and/or a HPADC, you can do that via the Indiegogo USB2SDR campaign.

http://www.indiegogo.com/projects/usb2sdr-software-defined-radio-startup
http://www.indiegogo.com/projects/usb2sdr-software-defined-radio-startup

Any support, even a small contribution, does count.
If somebody just wants to acknowledge the effort of a freeware developer, is most certainly welcome and can do that too in the Indiegogo campaign.

Best 73,
Christos SV1EIA

1646. problem above ~20MHz

Yahoo group: UHFSDR
Date: 2013-11-06 05:14:16 UTC
From: Ronald Wagner
Topic: 1646 Message: 1646

I'm intermittently working on my UHFSDR build and have come across an odd problem I'm hoping someone can help me with. So far I'm just working on the receiving end of things, using Rocky to test. I have the whole radio built and installed in an open chassis. The reception seems to work fine below about 20MHz, however at virtually any frequency above that I get a strong local AM station coming in at the center frequency.

I've checked the output frequency of the si570 on a 100MHz scope and it seems to be in the right ballpark. Setting the radio to a succession of increasing frequencies the si570 looks right as far as 50MHz. I didn't go higher as it seemed pointless. I think the si570 is generating the right frequency (2x the frequency selected in Rocky), but as I said, at about 20Mhz and up Rocky is dominated by the local AM station.

Does anyone have any thoughts on what I should look for?

Ron

From: Ronald Wagner
Topic: 1646 Message: 1649

Thanks Larry and Mike. I'll try sticking in a filter of some sort. For testing I just have a long wire stuck in the antenna jack. I wonder if using a balanced antenna or even a ground connection on the other half the long wire would help.

And I also have KNX 1070 at 50KW within 5 line-of-sight miles. That's the station I hear at the zero frequency. I'm pretty sure I used to pick up that station from my old amalgam fillings.

Subject: RE: [UHFSDR] problem above ~20MHz

yea .. get a bandpass filter for the front end .... its a mixed hetrodyne ??....

Might be also from the usb sound card ...

Figure out what station it is will also help to track the source down ... iv got KQNT blasting me ... look it up and my call ..... hi hi .. ouch.

if you have a tuner .. that would help eliminate sources ...

Subject: [UHFSDR] problem above ~20MHz

I'm intermittently working on my UHFSDR build and have come across an odd problem I'm hoping someone can help me with. So far I'm just working on the receiving end of things, using Rocky to test. I have the whole radio built and installed in an open chassis. The reception seems to work fine below about 20MHz, however at virtually any frequency above that I get a strong local AM station coming in at the center frequency.

I've checked the output frequency of the si570 on a 100MHz scope and it seems to be in the right ballpark. Setting the radio to a succession of increasing frequencies the si570 looks right as far as 50MHz. I didn't go higher as it seemed pointless. I think the si570 is generating the right frequency (2x the frequency selected in Rocky), but as I said, at about 20Mhz and up Rocky is dominated by the local AM station.

Does anyone have any thoughts on what I should look for?

Ron

Topic: 1646 Message: 1651

I had an old mfj preselector for SWL that I stuck in between my long wire antenna and the UHFSDR. That seemed to do the trick. Although perhaps not ideal, I was able to set the preselector for 50MHZ, set the UHFSDR to 147MHz and heard a local repeater without hearing/seeing KNX at the zero frequency.

Thanks for the help,

Ron

1652. UHFSDR and HDSDR

Yahoo group: UHFSDR
Date: 2013-11-10 14:53:31 UTC
From: Jim Sanford
Topic: 1632 Message: 1652

Mike:
I think you had suggested that I use HDSDR with the UHFSDR.

I am starting out with HDSDR and the FunCube Dongle, and have learned
that I need an EXT_IO to interface the hardware.

Questions:
1. Where can I get the EXT_IO.dll for UHFSDR?
2. How is the Si571 controlled -- I've never seen an
"interconnection" page, only instructions about the audio. (Obviously,
it exists...)

Thanks & 73,
Jim

i think that was directed twards me ...

you need a controller for the UHFSDR ... i used 2 different ones ...

A qrp2000 and a sdr2go ..

The qrp2000 uses a usb interface and connects to the control lines of the uhfsdr .... i also used a usb soundcard for Rx/Tx IQ interconnect.

As far as the funQube .. i have no idea ... that requires different control software driver -- i have no idea where to get it at ...

Jim and Mike:
The Si570 controller connects to H1. I have just tested my prototype
USB controller board. It plugs into H1 and uses the same chip and
firmware as the Softrocks. I publish more on it this evening.

So you're developing a USB control board? GREAT! I'll wait for that.
Most of what I've seen is kind of a klooge.

Will your board be just control, or will it have A/D & D/A as well? (I like the USB2SDR concept, but find it a bit pricey.)

What DLL will be required

Thanks & VERY 73,
Jim

My board is a clone of the Softrock USB control circuit. No A/D and
D/A. It has 2 inputs for paddles, a PTT output and can control 4
filters. If you wan stand alone, look at the STM32-SDR. It works well
with the UHFSDR, does not require a PC and has a touch screen.

Dave,

This is really great to have a control board similar to Softrock. If you make a clone, why not to use the ATtiny with more pins and make more powerful band control with 3 or 4 pins. This will allow to control more band specific filters then only four bands.

Regards,
Andy - YL2QN

You are thinking of the Mobo, mobokits.stormwarning.org and
ww.wb5rvz.com/sdr/mobo43/ for the SR v6.3 and the SR63ng.

W9AMR did some modifications for it to be connected to the UHFSDR.

I would have to look back in my emails for the details.

Hi All, here is the info I wrote a long time ago.
First off, ****DO THIS AT YOUR OWN RISK!**** Now that I scared you read on...
How to setup a MOBO to be driven with any Softrock or a "UHFSDR".

There are probably better ways to do this. But this works for me! The Mobo has a interesting input switching circuitry. Very clever and ideal for the 6.3(NG) We need to make a few changes. The mods are reversible no foil cutting necessary. If you use the UHFSDR I don't think the stock mobo firmware will work. I am using the Widget for a controller. Loftur or Art could answer that question. I am sure it could be modified if there were enough interested. There are other controllers that might work?

I run the 12v+ to the input on the 5v regulator and ground to the ground pin. Add a 470mfd cap to the input.
Remove C12 C17

Lift pin 9 on U8 and jumper the lifted IC pin 9 to pin 7 on same IC

P19 Pin1, S12V goes in here.

I2C, P13 goes to UHFSDR H2.

Radio antenna goes to Pin 9 U8 put a .1 cap in series with it. 25-50v rating is plenty.

TX antenna goes to P15 Pin 1 or 5

RX Antenna goes to P17

Use a double pole double throw relay use 1 half for antenna switching and the other to do something else if needed sequential keying for bias an such?. You could make up a ciruit using BS170 just like the 6.3 uses but I think the relay is easier and less prone to failure in the future. And the relay gives more flexabilty.

I need to test it a bit more and make sure it is 100%! So far no issues. I am using the Widget V.005 unified version.

I have a lot more to do to the project. When I am done I hope to go 160m to 2m. I will have more and better info coming shortly. It is not as hard as it looks to interface the MOBO to other projects. Take time to make sure your wiring is correct. Use the schematic to understand what I have don't Have fun with it!!!

Hi all,

Larry W9AMR recently built this and he has a fully functional 160-10M HF transceiver with 5W output. There is a single USB connection to the PC for both the IQ audio and rig control (Si570, band switching, T/R switching, Fan control etc.) He is planning to add a VHF PA portion to extend the freq range.

Larry is prepared to share the details of his project with others in the UHFSDR forum but he was not able to post. Maybe the list moderator can contact him if there is interest?

Andy:
Using additional pins on the larger device would require additions to the firmware which was not written by me. But, I will look at a dual layout when I add it to the UHFSDR board.

Dave,

This is really great to have a control board similar to Softrock. If you make a clone, why not to use the ATtiny with more pins and make more powerful band control with 3 or 4 pins. This will allow to control more band specific filters then only four bands.

Regards,
Andy - YL2QN

Larry, you mention below that you don't think the stock Mobo firmware would work. Is that really the case?

I think I have my UHFSDR working (thanks to help from this group) and think the next step would be something like the Mobo.

And are the buy instructions on the stormwarning site still correct for the Mobo?

Yes. The prices are still the same although the costs are dynamic due to changes in prices at the parts dealers. So far, the cost of mailing the kits has been the driving force in price increases. If you order, please ensure that you note the PCB costs have to be paid to Alex Lee.

1667. Bandpass board for UHFSDR

Yahoo group: UHFSDR
Date: 2013-12-03 23:53:19 UTC
From: <johntoscano22350@...>
Topic: 1667 Message: 1667

WB6DHW has a bandpass board that covers the HF bands. You can see it at:
http://wb6dhw.com/For_Sale.html#BPF http://wb6dhw.com/For_Sale.html#BPF

Has anyone developed a similar board for the 50-54, 144-148, 222-225, and 420-450 MHz bands which the UHFSDR is capable of tuning? It might be possible to use the WB6DHW board with all new inductors and capacitors to change the tuning, if those components would still fit in the allotted spaces. Another change needed would be the transformer at the antenna side. He uses a TC1-1 (now obsolete, and replaced by the TC1-1G2+) from Minicircuits, but this is good for HF and not for UHF. The UHFSDR uses a TC1-13M (now superseded by the TC1-13MG2+) which would probably be the part to use on a bandpass board strictly for the VHF & up bands (it does not go down to the 80 and 160 meter bands). The other issue is that these transformers from Minicircuits are sold only in a minimum quantity of 20 pieces, meaning you would need to buy 20 of each (about $82) to get one of each to build two bandpass boards, one for HF and one for VHF+.

Any thoughts on (a) whether this is a good approach to adding filtering to the UHFSDR, and (b) if anyone is interested in a group buy of the transformers so as to make the cost more acceptable for those of us interested in only 1 or 2 parts?

I don't have a UHFSDR at this point. I am thinking about building one to go with an STM32-SDR kit to have an all-in-one radio (no external computer needed). I think it could be really great for use as an IF radio to my microwave transverters, especially for rover use.

Thanks in advance.

John,
My first thought is layout might not work that well at VHF and above. It should be stripline etc.
I am interested in a 6M,2M. 1.25M and 70CM bandpass board. I should put that on the list of things to do ;-)
I have a UHFSDR and loads of STM32-SDR's ;-)
I did a bandpass filter up for 6 last week and it seemed to work. No much smoke out the pipe though. I should do a 2M or 1.25M one up to try.

The STM32-SDR does not to FM right now. But SSB works well.

Hello all,

I want to use my uhfsdr as a 144 mHz microwave IF. Thus, I was thinking of adding a 144 mHz bandpass in front of it. A few dB of loss would be ok for me, so I was going to use a 2 or 3 section helical bandpass such as the Temwell parts used in DEM transverters. I will lay out a small pcb to hold the filter and some sma connectors.

I may be able to fit a few on a panel, so I was wondering if anyone else was interested in this application. This would not be a good idea for direct use on 2 meters.

Hi Downeast Microwave actually has pcb's for the filters - they tell me you must just need to email or phone and tell if you wish the 2 or 3 section model. Been using a couple since VHF conf in Cedar Rapids a couple of years back.

They don't list the filters individually on their catalog page anymore, so you have to call them. I purchased a 2m helical filter from them at the CSVHFS conference last summer and they said they were having problems with their supplier.

Hi

@Mike

>wish there was an 5w amp that covered 160m up to 700MHz !!!

:-))) got one ! (average 2 watts to 5 watts depending on the frequency)

In fact, I had the chance to find (ham flea marked are full of treasures) a professional linear amp covering from 3MHz to 1300 MHz. It is based on a Motorola hybrid amp, one is acting as a driver, the two others are running parallel

36 dbm on 2 meters and 70 cm and 33 dbm on 1200 is quite enough for a field UHFSDR. The only drawback is the filtering. The design of the bpf is not trivial, I'm still working on it

@ Alan

The mobokit works from 1 to 30 MHz only... and connecting it to a UHFSDR is not for the faint of heart. As far as I know, only one ham succeed with such a hack. And the mobo is definitely more efficient on a softrock 6.5 than with a UHFSDR (mixer performances... I find the tayloe mixer more efficient on low band and Dave's dual diode mixer better on U/Vhf bands)

My "motorola" amp is certainly heavily copyrighted, I honestly cannot publish its schematic on the web. But using the same "spirit and inspiration" don't seems impossible to me. I must admit, I definitely don't have the knowledge and the skill to do it myself

73 and season's greetings

I think you would need one for 160m - 6m, one for VHF and one for UHF.

The K5BCQ 20W PA for 160m - 6m requires 1W input.

Kees, K5BCQ (AQRP group) is preparing a 5W driver to go with his UHFSDR.
He reckons testing is going well and the latest email says he has
ordered PCB's.

http://www.qsl.net/k5bcq/Kits/Kits.html - page down to "The 5W HF
Amplifier Kit #21 ...

1701. Re: [UHFSDR] Bandpass board for UHFSDR

Yahoo group: UHFSDR
Date: 2014-01-10 16:51:39 UTC
From: <edfinn11@...>
Topic: 1667 Message: 1701

i am almost there... I used eagle and built schematic symbols and footprints for the 2 section (pole) temwell helical filter that I got from DownEast Microwave. I also use split IF for my microwave transverters, so I put on the same rf switch as on the main board to supply IN/OUT sma ports for the IF.

I got stalled over the holiday, but the layout is mostly done. The board will be very small, so I will fit as many as I can onto my proto board. I may not get back to this until after the January VHF contest, since I have to power the stuff up and make sure all 10 bands are working properly.

Jim,

I haven't looked at the raw spectrum out of the uhfsdr while transmitting on 2m yet. Common practice is to have at least a low pass filter to cut higher order harmonics.

When I fire this up next, I'll have a look.

Ed

1703. Spurious Sidebands

Yahoo group: UHFSDR
Date: 2014-01-19 00:08:22 UTC
From: <artus1947@...>
Topic: 1703 Message: 1703

I have recently finished a measurement receiver following the concept by Wes Hayward in EMRFD. I have been looking at the sidebands of my UHFSDR in an SDR2GO. I see fairly significant signal degradation above 8 dBm output. I can drive the unit up to almost 18 dBm but it is very "dirty." I started with 2-tone ssb signals but switched over to cw testing. I am posting a couple screen captures in the photos section at 8 dBm and 17 dBm. I have 2 units and will be using them in the SRD2GO and in a STM32-SDR. I wonder if others have observed this with their units? Its not really an operational issue since I will be following both units with amplification and can keep the drive level to below 8 dBm.

Hi Jack

Tnks for info

Did you kept your 2-tone sepctrum capture @8 and 18 dBm ? there is so few document in the "pictures" folder that it could'nt be a bad idea.

As far as I remember, the value of the decoupling caps and filtering inductance located on the MMIC power line had a great influence in the frequency response of the amplifier. Could it also play some role concerning the spectral purity? And did you try to repeat the test above 430 MHz ?

tnks agn

Haven't tried it with anything other than the mmic's on the UHFSDR board. The HMC544 data sheet shows that with a 5V control voltage the 1dB compression point is a minimum of 36dBm(3 watts) and typically 39dBm.

Dave and Mike,

You want to stay below the minimum compression point because the linearity of your signal will be compromised (1 dB compression), and that will generate spurious. But for one watt, it will be fine. Hitite is good for large quantities, but Digikey will gouge you in small qty ($4.97 for Qty=10).
Check Peregrine semiconductors, they have great switches that maybe less expensive.

Just my two cents,
Jean-Paul (AC9GH)

Ok ... looks like im bumping along in the right direction ....

there seems to be a need to have a relay bd made for separating hf(to6M) 2M, 1.25M and 70CM .... for sending signal to a respective amp ...

and i guess the HMC544 would be fine for that .. at 1W....

I have a few ca2818c's coming .... and a few step up regulators to power them ...

CA2818C was 10$ and the 15-36V regulators were 4$ .... well see how this works out.

Least it will curb me from thinking on how i would mod my AQRP 20W amp for 100mw drive !!!

Topic: 1713 Message: 1713

Ok .. im back to this idea again ...

basically because the fst3251 cant handle 1W ... which means i cant put the block amp after the UHFSDR's final stage (100mW) ...

I need a design that basicaly has a SPDT for Rx/Tx control and have a few more (SMD??) relays for HF (AQRP 20W PA) VHF & UHF path out ...

There's a good chance that anyone that has a UHFSDR would want one in the future ...

Ill also forward this to Dave ... but since AQRP sends out for boards to be made more often than dave(wb6dhw) ... im just trying to get some one to add something to a panel ...

Subject: [AQRP] Next pass on a manual BPF/LPF Switch with Relay Rx/Tx

We've been at it again and I just sent of another board order to Advanced Circuits. This one is a QRP manual switch variation. The reasoning behind "manual" for THIS one is that it's small, simple, inexpensive, no power, and geared toward Tx. It's assumed that the Rx probably has much wider frequency range and employs a broadband automatically switched BPF assembly like the one offered by Dave, WB6DHW.....which can easily be controlled by the 3 band select lines from a Si570 Controller. It consists of a 2.5" x 3.5" host board with up to 6 individual 2.5" x 0.6" BPF filters or LPF filters. It has multiple coax attach methods on the board: Coax cable directly, BNC connectors, or SMA connectors.....your choice. Signal leads are wide and kept as short as possible with all wiring over a solid ground plane to minimize transmission line problems on the board. The 6 bands on the switch are plug-in and can be any 6 BPF or LPF filters. The assumption being that for Tx you would probably want LPFs. However, if you want to use pluggable BPFs for both Receive and Transmit, that's OK too. The board can be configured so that the onboard Tx/Rx relay can be connected to either end of the symetrical plug-in filters. In Mode 1 the relay armature switches the Antenna between the 6 plug-in filters and the Receive input (assumes the receiver has it's own BPFs). In Mode 2 the 6 pluggable filters (they can be LPF or BPF) are connected to the Antenna at one end and the armature of the Tx/Rx relay at the other end. The relay selects between Receive and Transmit/Amplifier and the filters are inline to the antenna for both. The relay is powered by 12V or 5 V and controlled by external PTT input. Aside: Some who want to use just one plug-in filter at a time and really minimize wiring can also do do so. Like Charley's Mini-HRO setup.....then you don't need the switch at all, but you need an assortment of plug-ins. The little 2.5" x 0.6" BPF/LPF filter form factor is not a "standard" yet but they seem to fit in well with the size QRP SDR units around here (AQRP). I measured a couple of LPFs for 40m and 20m on my MiniVDA-Pro and the Transmission Loss was <0.1dB with a very respectable Return Loss so the SWR is low. Of course, all these maeasurements are into 50 ohms. BPF data looks good too but I haven't built them up and tested them for all the bands. As an aside, I have a LOT of BPF/LPF boards and Amplifier boards around here..... some will be coasters most will not. 73 Kees K5BCQ

Hi John

Funkamateur, the german Ham magazine, has an e-shop where you can find wideband transformers

http://www.box73.de/index.php?cPath=82_138

Prices are a little bit higher than MCL's, but, as a non-European citizen, you can ask for a tax refund (called VAT in Europe, 19% of the QSJ)

Hi John,

My UHFSDR has a Bel S554 3184-00 for T1. This transformer is spec'd for
250kHz to 340MHz.

I'm in the process of assembling the board, so I can't vouch for the
performance.

Yes, Minicircuits is "a little different" from Mouser in their operations and they definitely prefer not to sell one or two of anything. I would not try to wind one because the core size and material is not readily obtainable (I have dissected one). What I use for Dave's BPF kit (I supply all the small parts) is a 1:1 Bell transformer (no CT) which works very well and has been measured in a professional lab to perform as well or better than the T1-1T all the way to 500MHz. The T1-1T and Bell are pin in hole parts (gull-wing for smt). You have to fold the leads under the part to solder it to the footprint on Dave's BPF board. I have those available for $1 each plus postage. I also have the Minicircuits TC1-1TG parts (used on the Si570 Controller kits) for $2 each plus postage. 73 Kees K5BCQ

From: MIKE DURKIN
Topic: 1724 Message: 1724

So i was thinking i might my UHFSDR and SDR2GO combo ...

It has the 1.9 firmware

Iv been looking to put together a 1W @ (hf through the top end of the Si570 class A) amp ... i need to assemble the parts i have and give it a test ...

If it works out i might sell it with it ..

This is just a feeler im putting out ... to see if any one might be interested or might be in the future ..

Its assembled right now in the case of a Atlas350XL ... id be selling the boards and related hardware only .. the Atlas is rough and would stay with me.

I also have an assembled(by me) bandpass filter of Dave's(WB6DHW) -- its still not tested yet --

1726. Is there a way to download for offline reading the ~300 messages posted in uhfsdr?

Yahoo group: UHFSDR
Date: 2014-04-10 00:27:11 UTC
From: David Feldman
Topic: 1726 Message: 1726

I am returning to my long-shelved UHFSDR project. I had purchased PC board and a few related parts some years ago, and want to catch up on the project's history and discussions. The "new and improved" yahoo group format is awful beyond words, so if there is someone that knows of a way I can just download the messages in chronological order, that would give me good reading material and avoid me asking questions for which there has already been discussion.

Thanks,

73 Dave WB0GAZ wb0gaz@...

i cant remember if i responded yet .. but yea .. id sell the sdr2go separate ...

Ill try to get a good close up picture soon ...
and a video of it working so that you know ...

I dont have the keyboard connector on the board ... and i used different encoders than what was part of the kit .... i might still have the push button integrated ones still .... im just not sure. Its been a while since i built it.

Iv been having some more heart problems lately and had a nuke test done today (fun being radio active -- not) .... ill know if ill have work done for sure in 2 days ...
Just sayin that im in no rush ...

1733. UHFSDR installation

Yahoo group: UHFSDR
Date: 2014-05-10 16:41:39 UTC
From: Jim Sanford
Topic: 1733 Message: 1733

All:
Finally getting around to installing, but am having trouble finding software installation instructions.

I found the cable interface instructions on Dave's site. This requires Si570 Parallel Port Control software which comes up as si570.ext.
I found a DIFFERENT set of connections on the yahoo groups site, with the /suggestion/ that the PowerSDR-IQ will control UHFSDR directly.

Can anyone help unconfuse me?

I have one PC with a parallel port, so will use that for one of my UHFSDRs, the other will be used with a laptop and USB port. I found Dave's schematic for the USB interface, does anyone sell boards? Which software/drivers go with this interface?

Finally, what is the latest PowerSDR-IQ that people are using, and where can I get it? Lots of files in the pwoersdr-iq group, but not clear (to me) which to use with either the USB or LPT interface for UHFSDR.

Thanks & 73,
Jim

1740. Intros & questions

Yahoo group: UHFSDR
Date: 2014-05-19 13:13:46 UTC
From: p-thomas@...
Topic: 1740 Message: 1740

Hello all!

I've had an interest in SDR before I even knew what SDR "was" so I'm glad to see that there are so many options today. Of course the number of options is part of the issue too!

Along those lines, if anyone is aware of a good SDR book or presentation or something that discusses a design and why certain things are done the way they're done, I would love to hear about that. That's part of my interest here... self-education, etc.

As to UHFSDR specifically, I've got a decent HF rig but was looking around for options to get SSB on 2m and 440. Originally I was debating a transverter but since I also am interested in SDR, I saw this around, and couldn't pass it up. ;-)

Ultimately I would love to be able to attempt some satellite operation. I have a separate rx, but would like a transmitter that's halfway decent. Of course "halfway decent" is subjective... has anyone ever characterized the UHFSDR design objectively?

Usually I try to not post much until I read through the post history (case in point, I see at least one self-run sensitivity improvement thread which characterizes some of the enhancements)... but has there been ongoing effort to pull changes into the design? Or is it mostly unchanged? If the latter, is there a centralized place to find mods for the design other than combing through "back issues" here?

Also I've been looking at a mounting option close to the antenna along with a computer, to avoid noise/etc issues as well as minimize loss. Being able to support multiple bands without physical switching would be a great help for me in this respect! I'm still trying to understand whether it's practical to have one design work from ~10MHz (or lower?) up to literally 700 (well, up to 70cm for transmit)... or if I should just let the HF rig do what it does and fix the UHFSDR at 2m and/or 70cm and call it good.

Speaking of design mods, are the kicad files available anywhere for use? Rather than just the PDFs?

Last but not least, if anyone has done any experimentation (with UHFSDR or otherwise) using standalone ADC/DAC chips rather than sound cards for SDR applications, I would love to hear about it. I'd really like to see more than +/- 48kHz of band on the scope if at all possible, as well as having maximum precision without worrying about unexpected circuitry. There are several fairly cheap 1MHz class ADCs and several not-outrageous 10MHz class ADCs, for example. Piping that natively to USB shouldn't be too hard, though the CPU impact might be a limiting factor eventually.

Sorry for the lengthy brain-dump, but glad to see the interest in the project! And 73....

well i finally found my answer .... and it works ....

in file quisk_conf_defaults.py in main quisk folder

find

bandlables

and add like this ...

```
bandLabels = ['160', '80', ('60',) * 5, '40', '20', '17',
'15', '12', '10','6', '2', '1.25', '70cm', ('Time',) * len(bandTime)]
```

Other interesting developments:There is a Google group (Hermes-Lite) that is developing a board based on the Analog Devices AD9866 which is a low cost "low band" transceiver chip. They are shooting for a very low cost transceiver package, on the order of $150 total including processing. The board is planned to be used with a BeMicro SDK for full compatibility with Hermes software.

The Open HPSDR group is experimenting with a new SDR architecture based on the new NVIDIA TK1 embedded processing board and digitizing the entire 0 to 30MHz radio spectrum in real time which will feed to this board, which will do the processing. The TK1 uses multiple "graphics": processing engines in conjunction with a high order programming language. The big advantage is that it eliminates the need to program an FPGA. All the processing will be done in software, with no firmware (FPGA) development. Makes my head spin.

Regards,
"Digital Steve", K1RF.

Interesting times.
I have the BeMicro SDK hooked up and programmed. I have the PCB from Rob Frohne but I'll wait for Steve's new board. It certainly brings DDC/DUC in at low cost.

I've decided to wait on the 64-bit Jetson due out later this year.

Lots of really interesting stuff going on in openHPSDR and elsewhere. August 23rd. Teamspeak was very enlightening and encouraging with regards to use of the Jetson TK1.

Interesting project. A while back I found the AD9364 which they developed
with Ettus Research (an early gnuradio contributor). The 12-bit A/D
doesn't provide a lot of dynamic range, but I see the AD9866 has a
programmable gain amplifier of some 42dB. I'm not sure if that will make
up the difference between a 12-bit A/D and a 24-bit.

Hi Glen,
I am not sure either but still does a great job.

Rob (KL7NA) has had Hermes-Lite up on internet using ghpsdr3-alex's
hpsdr-server and dspserver.
I and several others have hooked up to it and the receiver was thought
excellent by all.

Day to day use may show up deficiencies but it'll probably still out
perform any QSD/QSE rig.

So slight update ...

dont mod the quisk files in the quisk folder ...

just add

```
bandLabels = ['160', '80', ('60',) * 5, '40', '20', '17',
'15', '12', '10','6', '2', '1.25', '70cm', ('Time',) * len(bandTime)]
```

to your .quisk_conf.py that you place hidden in your home folder ....

Mike:
I don't think that is normal for LVECL. I remember seeing a
textbook square wave up to 2 meters from my Si570 on a 300 MHz scope.
Are the flip flops still triggering OK at 10m and above?

From: Mike
Topic: 1753 Message: 1755

Sorry .. i was measuring at the Si570 .... my bad .... i should see if the dividers are the same ...

I seem to have a sloping output from low band down to 10M ... 80M (4mhz) was 3Vp-p and 10M (56Mhz) was 1Vp-p ...

My reading might be poor because i don't have a good scope probe (its been repaired and 10X no longer works)

scope is a 100Mhz TekTronics 2336ya .... with a X10 freq addon ....

I have a dropping output from 160M(17W) down to 10M(5W) ... seen on a heathkit watt meter

and im finally getting back to seeing why it drops down as the bands gets higher in freq .... its like its got a gradual roll off ... (and the output matched -- more or less -- the Si570 levels)

Till i get a good probe or make a high impedance voltage meter .... i shouldn't jump to the Si570 being the source of the power roll off.

The 10X probe should be easy to repair.
Typically there is a break in the circuit somewhere, e.g resistor to tip.

Home made probes are also easy to make
http://www.ece.vt.edu/cel/docs/TekProbeCircuits.pdf
page 12 - 50 Ohm coax cable, 9M resistor and a small capacitor.

Mans,

GSDR from Genesis radios has a divide by 2 option also. As long as your controller uses Fred's PE0FKO software it will work. Just select QRP2000 as the radio. It was recently updated to work with DDutil, which will control filter banks through LPT port, among many other things.

73, Stew
KF5KOG

HI all,

I recently got a UHFSDR and need some info on what software to use for TX/RX.

For the moment I will concentrate on Windows software but later on my goal is to use it with Linux.

Apart from the UHFSDR I also have a WB5RVZ USB_I2C interface and a Roland External sound card.

My Question with this setup what software can I use and an documentation/ info available please.

Thank you in advance

1770. SDR-KIT For sale

Yahoo group: UHFSDR
Date: 2014-10-14 13:06:47 UTC
From: mihai_dumitru_home@...
Topic: 1770 Message: 1770

Hi everyone, I have an sdr-kit for sale

The kit contains:
- all the parts (including resistors and capacitors),
- an SI570BBB000141DG (10-810MHz, LVDS, 20ppm, Start-up frequency: 56.32 MHz),
- the original WB6DHW PCB (unplanted),

- a PCB projected by me which contains an ATTINY85-20SU for USB connection development.

Price 75 euro, including shipment.

Topic: 1778 Message: 1784

I am not using the band pass filter. I have the WB6DHW band pass filter here.
Do you think that will make a difference?
When the DSP is in the receive mode, Encoder #2 will adjust the Receive IQ Amplitude and IQ Phase
Parameters plus the receive headphone audio output level available on J14.
So, everything is turned down at one time. If I reduce the I/q level, I still want to hear what is there.
My idea is to place a attenuator in there, but if the band pass filter helps with that, then that's what I will try first.

Well not sure ....

I use the same knob to vary Tx level as i do the Rx ..
I also have volume control for my audio amp ....

Are you using another audio amp for a speaker .. or using a headphone ..?

I'm just saying that i don't have an issue with too much signal i
use a MFJ-1798 antenna ...

Topic: 1790 Message: 1792

Im looking to add to what i already have .. ie sdr2go & UHFSDR (class "A" Si570)

Im still cloudy on just exactly what a mobo4.3 kit is Alan ... and at 98$ pluss another 20$ some for a 6band filter kit .... i want to know exactly how its interconnected .... (like using WB6DHW SMD BPF board instead)

Iv seen AlexLee's recoding of Si570 controllers to use a pic32 ... and it looks promising ....

Frankly having the ability to control more than HF filters is what im looking for starting off ....

second ... there's the ability to take control of the Si570 from a sdr2go (like a buffer or go between-- that can take the commands from the sdr2go and route them to the si570) ... regardless if the usb is plugged in or not ...

I want to make my sdr more mobile and base (with PC) compatible ...

My SDR should do 902Mhz (on 3rd harmonic) Tx/Rx but there are no filter controllers that can handle that many bands ....

Iv sent this to other user groups because im wondering if there is any others that might be looking for the same thing ...

FYI--

There are several variations of the Atmel based Si570 controllers that provide control of up to 16 filters. One of the guys in the Austin QRP (AQRP) group is designing a board that will utilize an AT Mega chip to control both the Si570 and up to 16 filters. It will use a variant of the code that is in the MoBo Si570 controller. It is based on the ATTiny code that was used in the SoftRocks and has undergone several iterations. The following have contributed to the code development--DG8SAQ, PE0FKO, TF3LJ, 9V1AL, F6ITU, KF4BQ, and KY1K. I apologize if I have left someone out.

Hi Mike,

Are you aware that the Si570 controller code for the SDR2GO has been modified to allow control of 8 filters based on the Si570 frequency. Switching frequencies are stored in eeprom and as the Si570 is tuned, the frequency is compared with the stored frequencies, and 3 bits are set. I modified the code in the Freescale 9S08 chip to automate the filter selection.

Kinda ...

I know of only expensive deployments ... for HF AND vhf/uhf .... TS2000 ....

using HDSDR or Quisk with a UHFSDR(and class "B" or "A" Si570) would
net you HF and vhf .. but there are no bandpass filters for VHF/UHF AND
HF that i know of ....

Id like to keep my UHFSDR2GO as a complete unit and incorporate an
add-on in between the UHFSDR & SDR2GO so that a PC could also control
the UHFSDR and that go-between to control the bandpass filters -- which
would have enough control lines to use HF/VHF/UHF bandpass filters ....

The SDR2GO has only 3 control lines and its not enuff to automatically
switch filters for that many filters ...

id guess that 4 lines would be necessary .... 3 used (shared) as bcd as
used with the WB6DHW filter (or what have you) and the 4th to switch
between the HF and VHF/UHF routeing ...

Id like to see a wb6dhw 6 BPF board layed out with parts for 6M, 144mhz
220mhz and 440mhz and possibly 900mhz filters ....

Now the 900mhz would be fairly easy since there are helical filters
available that are used in maxtrac and GTx conversions as well as Ef
Johnson gear ....

I have a few in hand for 900Mhz that are centred on 915mhz ....

but im getting off subject ....

im hoping some one that has the capability’s to generate something like
this, see's that there is a need ....

The many softrocks out there probably wont benifit as much from
something like this ... they are more or less only HF ....
But all UHFSDR's can do VHF with a class B Si570 ...

Hi Mike,

My previous comments are in regard to the old SDR2GO. I don't know if
Dave has incorporated the changes in the STM32-SDR. Since the STM32-SDR
handles all of the Si570 control in the STM32F4 chip, the code is quite
different from the SDR2GO which uses the 9S08 for Si570 control and a
dsPIC for all the other processing.

I'm not sure if Kees has posted the revised 9S08 code for the SDR2GO. However, I have the source code for the 9S08 on my computer if you need a copy.

Hi Mike

A long time ago, SV1IXP described such a bpf switching system using Christo’s USB2SDR audio/interface board

http://sv1ixp.wordpress.com/homebrew-hfvu-sdr/

The « mobo » is fully dedicated to the softrock 6.3.
Adapting this « full RF band piggy-back extension » to a UHFSDR is possible but really tricky. Even if the mobo is able to command an external bpf filter (with 4 bits, that means 16 different filters) , this switch will only work on HF bands. For several software reasons, Alex and Loftur firmware can drive an I2C bus to control a filter switch, but the display section of the microcontroler of this very same firmware cannot show a frequency above… don’t remember. 40 or 99 MHz. That’s a pure cosmetic problem, but a really boring one.

The SDR-Widget, which is an audio processor/ Si570 driver with fully configurable I/O cannot be used for the very same reason (same unified firmware in fact). The bandswitch capabilities are here, compatible with the DG8SAQ drivers, but still the LDC display of the board cannot display VHF/UHF frequencies.

The STM32-SDR (kinda SDR2G on steroid) could be a solution. It has been developped with the UHFSDR in mind, don’t need any kind of computer to control modulation/demodulation of the rig, has a nice spectrum/waterfall display, and covers from 160 to the limit of Dave’s UHFSDR (with a AA Si570). But you should ask the development team more infos concerning the switching capabilities. As far as I remember, the STM32-SDR has only 3 bits to control any kind of switching interface. If you really intend to use all HF, VHF and UHF bands, that’s definitely not enough. Particularly when you are considering switching BPF and different amplifiers on 2 meters, 70 cm and so on.

I’m convince that VE7PKE’s team can modify the firmware to give us a dedicated I2C adress range to drive 16 different filters and switches. It would be easier than adding a 4th GPIO pin to reach the 1111 frontier :-)

Technically, everything depends on the way you are driving your Si570. I personally don’t think that measuring the frequency of the oscillator is a good option. Whatever system you choose to drive your Si570, you already have a precise indication of your working frequency : the I2C instruction given to the oscillator. Using this I2C info to a microcontroler –even an Arduino Nano could do this- will offer you an impressive quantity of GPIOs. This way, you’ll be able to control any kind and any quantity of filters, and even build a real sequencer to control the timing of your different amps and pre-amp during the swithing process

I tend to agree ....

A I2C slave on the same buss probably would be the cheapest path to fulfilment ...

plus probably could dump the 3bit on the sdr2go/stm32-sdr for something else .... or leave it i guess ...

But the real problem is COST ... i like many others already have a sdr2go and UHFSDR ....

I guess i could sell the sdr2go ... but i don't really want to ... but one of the other nagging issues for me is that the stm32-sdr has no FM ... and to leave that out of the picture is like leaving 9/10th of the operating use out of the picture when operating above 10Meters ....

1802. Re: [UHFSDR] BPF control

Yahoo group: UHFSDR
Date: 2014-11-08 17:48:34 UTC
From: Dave Miller
Topic: 1790 Message: 1802

A couple of comments on STM32-SDR.
We do have extra bits that we could add an extra pin on the BPF connector on next board run. Those bits are available on the existing boards so no one would left behind.

Bigger issue I see is the user interface. Current version only has to deal with 8 combinations. Thought would be required to add more options.

If there were enough requests for I2C functionality we could make it a feature in the future. It's actually not that huge a feature to add.
But it's only software. ;-). This request is best discussed on the STM32-SDR Yahoo Forum.

The FM feature request on the list and will be addressed in the future I expect. But it requires significant fiddling. This fiddling required the right person to tackle it. So far the right person has not had the burning desire and the energy to tackle this. Volunteers?

As pointed out in other threads recently here or other yahoo groups the software or firmware requires significant expertise and perseverance. This is constantly being undervalued in the amateur community. Open Source does not pay the rent and heat. Everyone needs to appreciate the time and efforts of John, Charley, Milt, Brian, Chris and Jack in the STM32-SDR firmware development. Other also have contributed many hours on project on things like documentation and hardware. ;-)

I am now stepping off the soapbox.

From: Marc OLANIE
Topic: 1790 Message: 1803

Many tnks for your explanations Dave

>Bigger issue I see is the user interface. Current version only has to deal with 8 combinations. Thought would be required to add more options.

Betrayed by the interface :-) I could’nt imagine such a problem. Does the crosspoint table has to be « interface accessible » or could this feature define during a firmware pre-configuration ? (just a suggestion). Very few hams are changing the filter switching plan during operations.

>If there were enough requests for I2C functionality we could make it a feature in the future. It's actually not that huge a feature to add.
But it's only software. ;-). This request is best discussed on the STM32-SDR Yahoo Forum.

The former question too.. you’re right. But the initial thread was starded with a more general subject. From my pure egotist point of view, a « I2C Bandswitch bus » would be easier to deal with than a fourth control bit… no pcb hardware mod.

>. So far the right person has not had the burning desire and the energy to tackle this. Volunteers?
I wish I could… Alas, I don’t have this talent :- ((

Pse be sure that we all appreciate your efforts. I know how much perseverance requires such projects like the STM-SDR

Hi Mike

An I2C slave on the same bus will cost you at least the price of a chinese Arduino nano clone (far less than changing your 2go for a STM). And this way you'll still have FM.

the only drawback is that you'll have to develop the code to trigger the bandswitching (the command of the filter, I2C or BCD is less complex)

Just my 2 cts

Mike KC7NOA

Hi Mike,

Are you aware that the Si570 controller code for the SDR2GO has been modified to allow control of 8 filters based on the Si570 frequency. Switching frequencies are stored in eeprom and as the Si570 is tuned, the frequency is compared with the stored frequencies, and 3 bits are set. I modified the code in the Freescale 9S08 chip to automate the filter selection.

73, Milt
W8NUE

Hi Mike,

My previous comments are in regard to the old SDR2GO. I don't know if Dave has incorporated the changes in the STM32-SDR. Since the STM32-SDR handles all of the Si570 control in the STM32F4 chip, the code is quite different from the SDR2GO which uses the 9S08 for Si570 control and a dsPIC for all the other processing.

I'm not sure if Kees has posted the revised 9S08 code for the SDR2GO. However, I have the source code for the 9S08 on my computer if you need a copy.

1809. Si570 Grade A, B and C

Yahoo group: UHFSDR
Date: 2014-11-26 22:51:51 UTC
From: leschyna@...
Topic: 1809 Message: 1809

Hi, I am trying to get up to speed on the Si570 and its three variants. Please help me understand the difference between the three grades of Si570 devices. I understand that the grade A version will go the highest in frequency, but my concern is in the supporting circuitry. Is different circuity required depending on which grade of Si570 chooses, ie CMOS vs LVPECL? Or is this only with regard to the internal workings of the Si570 device itself?

Sorry for the "Newbie" question.

Bob:
The circuitry is the same for all 3 speed grades. The CMOS output option will not work on the UHFSDR. Two complementary outputs are required for the I/Q generator.

it is a TO-220 case
here is the link.
http://www.mouser.com/ProductDetail/STMicroelectronics/LM323T/?qs=sGAEpiMZZMsprRPEdcYqIsesnynS6d4y http://www.mouser.com/ProductDetail/STMicroelectronics/LM323T/?qs=sGAEpiMZZMsprRPEdcYqIsesnynS6d4y
I wish they would just use a first class envelope to mail small quantity parts. 40 cent stamp
is cheaper then 4 bucks.
I can adjust the audio just fine. I want to control the rf input. the mmic can be adjusted with a pot in its
supply line. I saw the chart in a pdf, so I tried it, and rf level can be changed,
I tried a simple resistive attenuator and that worked even better to tame down that hot mmic..
I came across that variable 20 db attenuator with 50 ohm input and output by chance and figured, why not give it a shot. now, I just have to figure out how to make negative 3 volts . so that's what im doing now.

Hi Mike
78H05 indeed, in TO3 case. But if you are looking for TO220 or Dpack form factor, you'd better choose an LM1084. It's a 3 to 4 amp regulator, fix or variable (the variable model is 100% LM317 compatible, even considering the resistor network calculation)

Well, I have had success with the excessive gain and now it works better then I expected.
I installed a variable RF attenuator between C15 and U7. It is controlled by negative 3 volts.
Right now I am using a battery pack to supply the negative 3 volts for testing.
Before the simple mod was done, strong signals were pumping. Now the RF gain is variable with a 100k pot.
the part number for the variable attenuator is MAAVSS0006TR-3000 which I got from Mouser.
I ordered a switching regulator charge pump that will take positive 5 volts in and output a variable negative voltage. Also have a negative 3 volt regulator . with that installed, I can get rid of the battery pack.
The charge pump is TPS60400DBVR. The parts are relay cheap, I wish they learn how to use stamps and a small letter envelope instead of a big box. I highly recommend this addition.

Very interesting modification Robert. I suffer from overload of the uhfsdr from strong signals on 4m in the UK. I am intending to try your mod to see if it will help. Did you put the voltage adjustment pot before or after the Inverter? Presumably a fixed resistor is needed at the earthy end of the pot to stop the control voltage going above -1.6. If you have the values used it will save me doing the maths !!

From: rholsti@...
Topic: 1778 Message: 1822

Hi Geoff,

The output of the charge pump is not regulated so you will have to output to a negative 3 volt regulator.
100k pot is placed across the output of the regulator. the wiper is connected to the control of the attenuator.
I did not do math, just did the mod and it worked. Mouser does not have a negative 3 volt regulator in stock, they do have one that is adjustable, so I have that on order as well as the charge pump. I am still on
a 3 volt battery but will be off of that in a couple days. The adjustable negative regulator part number is
LM337KVURG3

1824. UHFSDR & Si570 & Quisk

Yahoo group: UHFSDR
Date: 2014-12-17 06:43:13 UTC
From: Mike
Topic: 1824 Message: 1824

Well ... sorry for the bandwidth ....

Ill start off as saying that i have a UHSDR with a Class "A" Si570 ...
it saposed to be good up to 1.41Ghz output ... mine is LVDS output.

Iv had a bit of a problem for a while of not being able to use anything
above 1.25M hamband for some reason.
I knew that usbsoftrock would set higher frequencies .... just not why.

I think i found the answer tonight .... and i hope Jim is ok with me
posting the change to hardware_usb.py in the softrock folder ....

actually i made 2 changes .. but ill get to the other later for users of
divide by 2 Rf front ends ...

im not sure what line number right now .... but its about 3/4 the way down.

```
# For now, find the minimum DCO speed that will give us the
# desired frequency; if we're slewing in the future, we want this
# to additionally yield an RFREQ ~= 512.
freq = int(freq * 4)
dco_new = None
hsdiv_new = 0
n1_new = 0
for hsdiv in SI570_HSDIV_VALUES:
n1 = int(math.ceil(SI570_MIN_DCO / (freq * hsdiv)))
if n1 < 1:
n1 = 1
else: <::::::: Remark
me with a "#" at the beginning of this line
n1 = ((n1 + 1) / 2) * 2 <::::::: Remark me with a
"#" at the beginning of this line
dco = (freq * 1.0) * hsdiv * n1
```

I know what the "else:" is doing here in this code area ...
but not
n1 = ((n1 + 1) / 2) * 2

If n1 was 1.1 from the previous code --- with wanting a freq of 940Mhz ...

n1 = int(math.ceil(SI570_MIN_DCO / (freq * hsdiv)))
4.85ghz / ((940Ghz * 4)
note: 4 is the lowest hsdiv you can have

then n1= 1.289893617 (BEFORE math.ceil FUNCTION IS USED)

n1= 1 after math.ceil FUNCTION IS USED (i had to go look it up ... lol)

so in equation n1 = ((n1 + 1) / 2) * 2 where
n1 = ((1+1)/2)*2
n1 = ((2) /2)*2
n1 = (1)*2
n1 = 2 ..... n1 started as 1 and when ever n1
is below 2 , it will be recalc'ed back up to 2

So ... when the DCO freq is checked in the last line .... it will always
be outside the Min / Max DCO frequency limits ... if you had a Si570
class A OR B !!!(BTY .. dont spend the extra money on the Class "A"
Si570 .. you don't need it)

with n1 being pushed to 2 when ever its below 2 the max freq the Si570
can output is 606.5Mhz .... thats 303Mhz with a /2 Rf front end.

Or my reasoning is totally messed up ... but this did work for me !!!!!

YMMV !!!!!!

Mike,

If you cannot find a US seller try Jan G0BBL at SDR-kits in England. He carries a wide range of Si570s.

Mike,

The Si570 is tiny. Drop Jan a line and see if he will help on the shipping by just popping one in an airmail envelope. He is a good guy and "ham friendly" . That is if you cannot source one in the USA, which seems weird because I am pretty sure he buys in bulk from Digikey or Mouser.

Hi Mike

I do, and it's working quite well.

I'm not in my shack right now... Can't help you a lot. But as far as I can remember, there is a small adaptation (not even a "mod") concerning the value of the inductance located in the supply of the final MMIC circuit (L1 560 nH). You'll have to dig in the mailing list, a long thread was talking about that.

My main UHFSDR board is heavily shielded, V and U amps are in there own shielded enclosure, with their respective bandpass filters.

Mike:
I tested it several years ago on 2M FM transceive and 70cm receive as well as receiving the audio(25 KHZ wide FM) of our local UHF TV translators. I was able to work through a repeater about 25 miles from here(line of sight) barefoot using a 20 meter vertical as an antenna. I used PowerSDR.
I know there are several that use the UHFSDR as a 144 MHz IF for microwave work. Perhaps they can chime in.

mostly for filters at the moment .... for 2m, 1.25m, 70cm ,33cm and 23cm ...

If found a pcb bpf for 23cm that looks good ....

On 01/26/2015 12:30 AM, Marc OLANIE Marc.olanie@... [UHFSDR] wrote:

Hi Mike

I do, and it's working quite well.

I'm not in my shack right now... Can't help you a lot. But as far as I can remember, there is a small adaptation (not even a "mod") concerning the value of the inductance located in the supply of the final MMIC circuit (L1 560 nH). You'll have to dig in the mailing list, a long thread was talking about that.

My main UHFSDR board is heavily shielded, V and U amps are in there own shielded enclosure, with their respective bandpass filters.

Objet : [UHFSDR] vhf uhf or UHFSDR

So i was wondering this evening ....

Who is using there UHFSDR for VHF or UHF operations ?

is there any advice ?

No. It controls eight at a time but they are easily plug and play and it supports roll your own filters.

1843. RE: [UHFSDR] vhf uhf or UHFSDR

Yahoo group: UHFSDR
Date: 2015-01-26 21:45:17 UTC
From: Marc OLANIE
Topic: 1832 Message: 1843
Attachments: 2 described; binary payloads are missing from this source WARC

Hi

I don’t think the Mobo kit is really adapted for such a system.

Right now, very few Si570 controlers are able to cover the 700 MHz of a « Grade A » (the STM32-sdr is amongst them, the SDR-Widget can’t). An I’m not aware of a firmware that could deal with a full set of HF bands, 50 MHz, 2m, 1.25m and 70 cm (adding 33 and 23 cm transverters adds another layer of band switching, as the UHFSDR cannot directly reach the 33 and 23 cm band).

One of the best and easiest way to do it is the DG8SAQ/PE0FKO system : configurable crossover points depending on the I2C dialog between the microcontroler, the software and an I2C based filter switch. But as far as I know, all the controlers using the DG8SAQ platform (with the crossover filter params) are unable to go over 50 MHz

This feature has to be written by a code pundit. The STM32-SDR team is considering this option, but this feature is not scheduled in a near future. Right now, the UHFSDR with STM32 can just benefit of a 4 bit binary data word… not enough for what you are looking for.

1844. Re: [UHFSDR] vhf uhf or UHFSDR

Yahoo group: UHFSDR
Date: 2015-01-26 22:36:22 UTC
From: Mike
Topic: 1832 Message: 1844

Nope .. your right ..

and i do believe that the SDR2GO would allow any entry value ....
outside the operating range of the Si570

that's why im trying to get a ubw32 with "alexlee188-UBW-emulator" Alex
Lee ported DG8SAQ/PE0FKO V15.12 firmware working with mplabx & pic32 ..
to add the extra cross over filter points ... and to add the 1/3
sampling once the 700Mhz top end hits for the 33cm and 23cm ....

granted iv never tried 33cm with the uhfsdr ... but since the harmonics
of the Si570 are saposed to be fairly strong, im optimistic that it
would work out ....

I do already have some 915mhz centred filters and as soon as i get a
DG8SAQ/PE0FKO clone working ... ill see how the 33cm works on a uhfsdr ...

my other problem is that i do not have a wide band amp that goes much
above 400mhz .... my CA2818C might make power till 600mhz ... but its
unknown. (came across one that's spec'd from 30Mhz to 2Ghz @10W !!! --
but spendy)

The QRP2000 im using is quite happy with me telling it to go to 700mhz
(1.4Ghz /2) .... and my 100Mhz scope with X10 time base switched on .. I
can see power delivered to a dummy load .... but im sure you can guess
that my TekTronics 2336YA is not calibrated that far from its operating
range ....

Untill some one gets a non-computer platform working with NFM ill
stick to using a micro computer for the I/Q mod/Demod .... An Odroid-X2
if any one was wondering.

Might be the STM32-SDR .. but no word on that front yet.

1845. RE: [UHFSDR] vhf uhf or UHFSDR

Yahoo group: UHFSDR
Date: 2015-01-27 01:25:52 UTC
From: Silverfox
Topic: 1832 Message: 1845

The mobo control program does manage the si570 in any system with I2C control.

Alan - W6ARH

From: UHFSDR@yahoogroups.com [mailto:UHFSDR@yahoogroups.com]
Sent: Monday, January 26, 2015 1:45 PM
To: UHFSDR@yahoogroups.com
Subject: RE: [UHFSDR] vhf uhf or UHFSDR

Hi

I don’t think the Mobo kit is really adapted for such a system.

Right now, very few Si570 controlers are able to cover the 700 MHz of a « Grade A » (the STM32-sdr is amongst them, the SDR-Widget can’t). An I’m not aware of a firmware that could deal with a full set of HF bands, 50 MHz, 2m, 1.25m and 70 cm (adding 33 and 23 cm transverters adds another layer of band switching, as the UHFSDR cannot directly reach the 33 and 23 cm band).

One of the best and easiest way to do it is the DG8SAQ/PE0FKO system : configurable crossover points depending on the I2C dialog between the microcontroler, the software and an I2C based filter switch. But as far as I know, all the controlers using the DG8SAQ platform (with the crossover filter params) are unable to go over 50 MHz

This feature has to be written by a code pundit. The STM32-SDR team is considering this option, but this feature is not scheduled in a near future. Right now, the UHFSDR with STM32 can just benefit of a 4 bit binary data word… not enough for what you are looking for.

Sent: Monday, January 26, 2015 2:36 PM
To: UHFSDR@yahoogroups.com
Subject: Re: [UHFSDR] vhf uhf or UHFSDR

Nope .. your right ..

and i do believe that the SDR2GO would allow any entry value .... outside the operating range of the Si570

that's why im trying to get a ubw32 with "alexlee188-UBW-emulator" Alex Lee ported DG8SAQ/PE0FKO V15.12 firmware working with mplabx & pic32 .. to add the extra cross over filter points ... and to add the 1/3 sampling once the 700Mhz top end hits for the 33cm and 23cm ....

granted iv never tried 33cm with the uhfsdr ... but since the harmonics of the Si570 are saposed to be fairly strong, im optimistic that it would work out ....

I do already have some 915mhz centred filters and as soon as i get a DG8SAQ/PE0FKO clone working ... ill see how the 33cm works on a uhfsdr ...

my other problem is that i do not have a wide band amp that goes much above 400mhz .... my CA2818C might make power till 600mhz ... but its unknown. (came across one that's spec'd from 30Mhz to 2Ghz @10W !!! -- but spendy)

The QRP2000 im using is quite happy with me telling it to go to 700mhz (1.4Ghz /2) .... and my 100Mhz scope with X10 time base switched on .. I can see power delivered to a dummy load .... but im sure you can guess that my TekTronics 2336YA is not calibrated that far from its operating range ....

Untill some one gets a non-computer platform working with NFM .... ill stick to using a micro computer for the I/Q mod/Demod .... An Odroid-X2 if any one was wondering.

Might be the STM32-SDR .. but no word on that front yet.

1847. RE: [UHFSDR] vhf uhf or UHFSDR

Yahoo group: UHFSDR
Date: 2015-01-27 10:36:28 UTC
From: Marc OLANIE
Topic: 1832 Message: 1847
Attachments: 2 described; binary payloads are missing from this source WARC

Yep, agreed Mike
In fact, that’s what I’m using right now. But the USB Bit Whacker is mostly considered as a scary thing. It’s austere lack of « human interface » and cryptic use discourage most of hams. (my UBW is a chunk of Dave’s 995x QSD board that uses the same kind of PIC). Alex’s code is definitely perfect. Wish I could add a simple LCD interface and optical encoder, but my programming skill is equal to the inverse of infinity :- (
For the output stage, I had the chance to find a professionnal wide band amp made with 3 Motorola hybrid circuits, delivering 35 / 37 dBm from 3 to 1500 MHz. Far enough to drive a couple of Mitsubishi « M series » hybrid for V and Uhf and a G6ALU for HF bands
Anyhow, if you succeed driving your UHFSDR inboth ½ and 1/3 sampling mode with a full fledge filter set, I’m pretty sure a lot of UHFSDR users will be concerned

@alan : you’re definitely right, Alan. But you must admit that pluging the Mobo on a UHFSDR is not a cakewalk. Too much wires, too much risks of interfering signals. And Alex’s and Loftur’s firmware cannot display the right working frequency over 99.99 MHz. It’s a pure cosmetic problem, but a important one from my opinion (the Widget using the « unified firmware » has the very same limitation). This display limitation is unknown to SDR2Go and STM32-SDR familly, but the switching functions are limited (not enough bands, no crossover choice). The « perfect interface » is yet to be developped :-))
Wish I could have a 1/1296 MHz UHFSDR with a nice 200 kHz waterfall bandscope and frequency display, an integrated SSB/FM modulation-demodulation processor, a I2C configurable filter command, a plain I/Q output (for QRA/computer based demodulation and control) and dual RX capabilities.

>Marc ...

>what wide band part did you use?
The linear amp. This RF block is made with three Motorola hybrid bricks (two in parallel acting as a driver, one in « final » stage). The whole thing needs a 24 V power supply.
This amp was formerly used in a TV broacasting system.
The power output is strong enough to drive a medium power narrow band amp (2x 70 W hybrid Mitsubishi for the 2m and 70cm, and probably a G6ALU 150 W push-pull or equivalent, not yet decided)

Topic: 1832 Message: 1850

I see ... how much did they all cost ...?

the Triquint TGA2237 cost 160$(usd) and can output 10W .... i figure 7W should be plenty linear and its spec'd / rated from 30Mhz to 2.5Ghz ... and i bet it will work just fine down to 160M .. just need to reduce the drive as the gain get's high ....

Im still looking for cost effective solutions ...

AQRP 20W(pep) amp was 55$
2M amp = ?? 50 or more
1.25M amp = ?? 100 or more
70CM amp = 50$ or more

that's 250$ with 33cm 23cm still to go ...

Im tempted to get a Triquint TGA2237

and Triquint TGA2237 needs no input out transformers .... though a switched Drain RFC that's made for the specific band spread .... im sure that one will not make good power from 160M up to 2.5Ghz ...

1852. Re: Attiny85 programming usbtinyisp help please

Yahoo group: UHFSDR
Date: 2015-02-07 13:25:21 UTC
From: Stephen Farthing
Topic: 1851 Message: 1852

Hi,

If I understand it rightly you had an already programmed ATTiny85 and tried to reprogram it?

If this is true then I think the problem that you have is that because the ATTiny 85 has already been programmed you cannot reprogram it using a low voltage programmer, such as the AVRISP11, because the pins used for programming have been disabled to allow them to be used by the ATTiny85 for other things. This is a real curse and the reason why I never use them in hobby projects myself. To reset the chip so you can reprogram it you need a high voltage programmer such as the AVR dragon, or one of the many DIY designs on the net.

There is an article here http://pe0fko.nl/Fuse-restore/ which explains more.

Hope this helps,

Steve G0XAR

Hi Seb,
I am not familiar with AVRDude, I gather it is pretty widely used though.
For most work I use AVRStudio and GCC on a PC and an AVRISPMk2 programmer.
For resetting fuses I use an AVR Dragon. I never had much luck with DIY
programmers. I think with micro controller programming it is enough to
focus on just that and buy stuff in, like the AVRISP which IIRR was £23.00
to handle the donkey work. The AVRStudio and GCC are free and very good.

Anyway, good luck with the project.

Regards,

Steve G0XAR

The chip you got from the Softrock has the programming fuse blown, so that
it cannot be reprogrammed. Blowing the programming fuse makes the reset
line available for use as a regular I/O pin, and the Softrock uses that pin.

You can reset the programming fuse and reuse the chip with a high-voltage
programmer. A google search for "avr programmer high voltage" came up with
this project:

http://www.simpleavr.com/avr/hvsp-fuse-resetter

which is what you need. After resetting the fuse, you can use your
existing programmer.

Glen, kc0iyt

As an alternative, if you have an Arduino board you could try this
http://www.rickety.us/2010/03/arduino-avr-high-voltage-serial-programmer/
One of the comments says “I accidentally programmed the RSTDISBL fuse on my ATtiny85. Your schematic
+ sketch worked great. Unlocked it in a second.”

The one thing i don't understand ...

your not saposed to be able to reprogram a softrock AVR without a high voltage programmer .... so it should be unchanged.

perhapse you did some thing else .. maybe plug the AVR in backwards ..??

I could be off in left field too ...

From: tomm1111@...
Topic: 1860 Message: 1860

I have a problem with CFGSR program recognizing/controlling the Si570. I build a USB interface and programmed the AVR chip. When I connect the USB interface to my computer and load the CFGSR software it immediately recognized the AVR chip. However, it doesn't recognize the Si570 used and cannot control it.

Any suggestions on how to fix welcome.

Do you see SLC SLA activity?

did you enter the correct startup freq of your Si570 and the correct crystal frequency?

I think CFGSR can query the chips now ... if loaded V15.11 or higher firmware to AVR ...

check pull up resistors, connections to Si570

Thanks for the reply. Yes, I can see SLC and SLA activity on both the UHFSDR and the USB interface. However, CFGSDR (v15.11) cannot query the Si570. I will check the start up frequency.

I may try to reprogram the AVR. I programmed it with an arduino.

Topic: 1860 Message: 1865

The new AVR arrived (Thanks Cecil!), but the result is the same. CFGSR does not recognize my Si570.

I think I figured out, but I don't know what to do about it. When I get to this in the assembly manual the voltage does not drop at all.

45.Verify H1-3 < 0.5V (0.82V reading is OK as discussed in forum)

Does this indicate a bad ADUM1251? Not sure what else to test at this point.

73,
Tom

the ADUM1251 is easy to test ....

ground the input to one ... either SLA SDA and the output should go low ....

you can ground the output and the input should go low too ...

i would hope you have the proper pull up resistors installed ....

Kinda odd that the ADUM1251 went bad ... its an isolator and its saposed
to be rugged

your the second person that i know of that had a ADUM1251 go bad ....
I was the first for me ...

Topic: 1869 Message: 1869

Hello,

My name is Jim and I am always interested in building radios. The only commercial "true" kits out there that are worthwhile building to me are the K2 and Sienna. I have an unbuilt K2 with "the works" waiting for me to build. I will probably buy the Sienna, as well. Most other commercial kits provide you with SMDs already mounted and soldered. I'm not interested in partial kits - I have built over 50 Heathkits and don't want any help building. I have a full set of surface-mount tools and can handle any job.

Lately, I've gotten into independent designs like yours and am presently working on the M0NKA and SDR Cube. What I like about them is that they are challenging. Soldering an STM32F405VGT6, LQFP100 package is not for the faint-of-heart, but it is very satisfying and makes me feel alive! By the way, it worked the first time!

What I would like to know is of this project is like that. Also, where do I start? What is the latest and greatest version(s)? Etc, etc, etc.

Thank you for any help you can give,
Jim

Jim:
You can access schematics and parts from my for-sale page at
<http://wb6dhw.com/For_Sale.html#UHFSDR>
The board is mostly surface mount. Most are sm0805. The IC's are
soic and ssoc.
I sell a mini kit with the harder to find components except the Si570(I
don't include it because there are several speed variations).

*Alan - W6ARH is selling a full kit including the PCB, Si570(1400 MHz
version), and all PCB parts. Contact Alan at <alan.r.hill@...>*

The UHFSDR is a low power(20- 100 mW) exciter, so you will need an
amplifier. The Si570 needs to be connected to a computer through a
parallel port or some interface board. The USBIC board I sell is
designed for that purpose. The UHFSDR can use most any of the SDR programs.
The frequency range is 1/2 of the frequency of the Si570.
You will also need a bpf for the receiver and a lpf for the transmitter.

Dave - WB6DHW

Update on Hermes-Lite.
I have 2 built, one working and one I have to troubleshoot. Everything
on the second one looks OK but I'm not getting off air signals.

The first one works exceedingly well and when put up against Hermes it's
a revelation as to what you can do with this DDC/DUC rig for $150.

Soon I shall add the 5W PA.

I have a picture on my QRZ.com page and http://g0orx.blogspot.co.uk/
also has a write up.

Noise floor is -120dBm, in this shot the AGC settings were wrong.

Hi Jim,
If it's a real challenge you are looking for and high performance to go with it, there is the HiQSDR and Preselector/PA units at hiqsdr.com and the openHPSDR gear at openhpsdr.org.

Those projects are available both for self-build or as built-up units.

Hermes is in OpenHDSDR and I believe that the only way to get a board is in an ANAN-100 or similar. Hermes Lite is a new implementation where Steve Haynal took a broadband chip and mated it to a inexpensive fpga with code ported from Hermes. Goal is to have software compatibility with OpenHDSDR and provide a cost point is much less than the original Hermes.

We are in Beta now and development is progressing.

You're right about "challenge", Sid. I can't even figure out how to order or what is even available to order. Maybe I'll just begin building the K2...at least I already have all the parts!

This emphasizes the common problem with all of these "independent" projects for people like me, who don't really have a lot of time to start from the beginning - no discernible road map to success. Much like starting late with N2PK's VNA, you need to spend a month on research before you can even have an idea where to begin. I don't want to waste my life on research. I want to "jump right in". But, thank you anyway.

No one knows how to effectively document their projects any more, nor do they care. The common answer is to "do a search" through thousands of messages. That is becoming more and more impractical. Have fun trying to have fun.

Hi all

@John KE5SSH
« I believe that the only way to get a board is in an ANAN-100 or similar. »
Just to mention. Apache Labs is selling the bare bcp of the 2 models (Angelia and Hermes) for $18 (without S&H fees). Not so expensive if you’re considering it’s a 8 layer board (at least less than the ADC… 100$ apiece :-D). But, as you said, the Hermes Lite is an important project (just to let you see if you are able to solder QFN IC’s. The Hermes boards as around 5 or 6 QFN and the Cyclon itself, a quite big QFP)

@Jim
I have a slightly different point of view concerning these multiple projects. Dave’s UHFSDR has a fantastic assembly manual with a comprehensive step by step debugging guide. Ivan VE3IVM made a « one step website » fort the N2PK and gives a clear index of all the important documents you must read (and at least a full schematic and BOM). Same remark with the extensive documentation of G3XJP’s Picastar, Scotty’s Modula Spectrum Analyzer etc.

I must admit that all these documents do not respond to the « heathkit-like policy » offered by the impressive WB5RVZ « softrock guide » collection. But these nobrainer’s assembly manuals (take a red-red-orange resistor, bend it’s wires, put in at the R22 position) are not what I would call « ham brewing for fun and profit ». You’ll probably have the fun to see your rig running, but you won’t have the profit to really understand how it works. And self-education and understanding is, to my sense, the first goal of hamradio.

Sometime, you’ll have to digg in the heavy documentation of a long-living project. Asking simple questions trigger from time to time a « read the f… manual » sent by angry old-timers of the mailing list. But you’ll also have beginner’s explanations from other people who love to share.

:-)

I agree strongly on that point. I wish originator of a project would maintain the pool of information so that those who are interested can come up to speed quickly. The idea of using the
Yahoo Neo interface to search and read hundreds or thousands of past messages is not appealing.
Also unless you research thoroughly there is a possibility that you might miss a later modification
/ update in which event you might start building an older version.

In the case of the Hermes Lite, there is wiki pages that trys to bring all the information together and organize it. Which seems to me to be a pretty good way to go about it. This way it's a group effort and a living document.

Yes, yes, that's EXACTLY the problem. How about a list of everything, at least? They could have lists for firmware, BOM, and mod versions. That would greatly improve the process.

I had to create documents for M0NKA before building it, due to the rate of changes happening. That one is a relatively new project (last year), so it was somewhat easier to "catch up". Most of the others have roots from years ago and are time-killers.

Anyway, that's my 2¢

Hi Jim,
I suppose a bit of reading is necessary but cloning Hermes-Lite and Hermes-Lite.wiki contains all the info needed to build the board and program the FPGA.

Most of the parts can be ordered from Digikey, the Samtec connector as a free sample form Samtec.
Arrow stocks the BeMicro CV and the Waveshare Ethernet from Amazon.com.

There are BOM's in the documentation in a form to submit to Digikey.

The SDR software is an issue where you may need help with - PowerSDR (from openhpsdr.org) and HDSDR under Windows.

Steve has done a sterling job with the documentation and keeps it up to date as well as doing the development, answering emails, all in tow with a day job.

Although there is a lot of documentation, the Hermes-Lite and Hermes-Lite.wiki are not that involved and you don't have to spend an enormous amount of time reading to get familiar.
Even how to program the FPGA is outlined step by step.

It's a developing project and changes will inevitably follow, the 1.21 version is the current one and the 2.0 version is in development.

John, AC9HY is ably taking on the preselector/PA work - clone Steve's github and "git checkout softrock" will switch to his fork.

Likewise IK1XPV's fork (git checkout audiocodec_1) implements a codec board to add sound support.

The latter two projects can be considered some time after Hermes-Lite is up and running and are not absolute necessities. Some guys have added different BPF/LPF's and PA's.
I am looking into using the 100W PA/LPF section from an IC-737 and keenly following John's work.

Depending on what OS you use, the vendor or more correctly the leasing company also tracks and controls your computer software and open up back doors into your system.

If you buy from Amazon, EBay, etc. they track your purchases, analyse them and present what other purchases you may be interested in whichever search engine you use.
73 ... Sid.

OK Jim,
I hear you.

My first receiver after getting my license was a 23 valve double conversion superhet and I have built many other rigs including fully synthesized ones like the one in Ham Radio Today, a long defunct UK magazine. I had to redesign parts using datasheets and a scope to get it working as the author, Frank Ogden, G4OGP didn't intend building it for publishing and had not documented it fully.

I also built the Omega by Tony Bailey, a synthesized rig also published in HRT.

DDC/DUC SDR and even QSD/QSE is more fun than the old steam radios and in its way very challenging if you look beyond the hardware build. Even then 144-pin FPGA's are not for the feint of heart and I certainly wouldn't want to go back to basics designing a 4 or 8 layer PCB as found in my SDR rigs.
Likewise I leave the firmware up to those who understand Verilog better than I.

Sid,

I was discussing the Hermes Lite last evening with my pals Jan, G5BBL and Alan M0PUB. Alan has built a Hermes Lite but had to drill the board so that he could mount the cable modem chip which has a heat sink underneath it. As you can imagine doing this on an 8? layer board was a bit nerve racking. I was wondering how you overcame this. I think he ordered his board from OSH Park. However there seems to be another set PCB available from Tindie.

I had already soldered the AD9866 to the 1.2 board when Steve mentioned it.

The Hermes-Lite boards are 2-layer.

Steve sent me a 1.21 board which already has the hole drilled and that's
the one I built up first.

Jim Smith told me that oshpark's boards are dearer and they require a
minimum order of three.

I know Jim got his from Tindie and Steve Haynal has also recently got
boards from them, I would think 1.21.

Hi Tom

Before considering the software part of the system, you should choose the best firmware for your needs. Almost all software under windows or linux will fulfill your wishes. But what’s between the hardware and the software is almost as important.

The firmware –and the microcontroler holding it- has two major functions : driving the I2C’s Si570 bus, and switching the differents bpf/ lpf depending on your working frequency. You also can add sequencer’s functions in the code to accomodate with different kind of power amps.

The choice –and configuration- of the « firmware stage » will depend on the way you intend to use your UHFSDR. Do you plan to use it only on the HF bands or only on V/UHF ? or both ? etc

1911. UHFSDR with parallel port

Yahoo group: UHFSDR
Date: 2015-03-27 11:31:10 UTC
From: sergio.lopez.llorens@...
Topic: 1911 Message: 1911

Hi all,
I'm going crazy with this... then "I'll do with a little help of my friends" like the song.
My english is very poor then I'll be short in my words, sorry:

1. Have Windows 7 with parallel port machine
2. I want RX/TX + SI570 control from parallel

then I choose PowerSDR 1.19.3.15 Setup.msi (previous installing _pSDR2_CPG_Default.exe, _pSDR2_CPG_IK3VIG.exe, _pSDR2_CPG_IK3VIG-2.exe)

3. I've found two connections types in
http://wb6dhw.com/UHF-SDR/UHF_SDR%20Assembly%20Manual-with%20SV1OBT%20suggestions.doc
http://wb6dhw.com/UHF-SDR/UHF_SDR%20Assembly%20Manual-with%20SV1OBT%20suggestions.doc

and

PowerSDR-IQ includes provisions for controlling the Si570 and the T/R line of the UHFSDR. The parallel port connections are differect than other PowewrSDR versions.

UHFSDR db25(Parallel Port)

H1-1 connect to 5V TP next to H1
H1-2 19 Ground
H1-3 1 I2C SDA for Si570
H1-4 16 I2C SCL for Si570
H2-3 25 Ground
P2-1 8 /Rx Tx

I've tried the second one with T/R line and PowerSDR 1.19.3.15 Setup.msi (cant see if is -IQ or not)
It doesnt run for me, which one is correct?
To test I plugged headphone in UHFSDR To Lin connector to hear something but no noise at all and software doesnt allow me freqs upper 60 Mhz...

So sorry for that questions, could you help me? Thanks in advance

1912. Re: [UHFSDR] UHFSDR with parallel port

Yahoo group: UHFSDR

From: Dave
Topic: 1911 Message: 1912

Sergio:
The first connection is only for use with Si570.exe. If you have a
strong local station, you should be able to use Si570.exe set at twice
the frequency and hear the signal.
The second requires PowerSDR-IQ. PowerSDR 1.19.3.15 Setup.msi does not
have the parallel port support. Try PowerSDR2.4.4_for_Homemade_Rigs.
With my USB interface, any of the SDR programs that allow setting the
multiplier to 2 should work.

Dave - WB6DHW
<http://wb6dhw.com>

You would need a very strong signal to hear it at the Lin jack.

1913. HMC482 replacement

Yahoo group: UHFSDR
Date: 2015-03-30 16:48:37 UTC
From: Geoff
Topic: 1913 Message: 1913

I have to replace the HMC482 (U5) in my UHFSDR. Unfortunately it seems it is discontinued. Does anybody know of a suitable substitute or a source of supply for the original HMC482 which would be the preferred option.

Geoff:
The Freescale MMG3H21NT1 is a replacement. Arrow has them. Farnell doesn't. Mouser, Digikey, and Newark do, but they are not convient to the UK.

The first connection is only for use with Si570.exe. The second
requires PowerSDR-IQ.
You would need a very strong signal to hear it at the Lin jack.

Many thanks Dave. I note it is rated at 5v so I am thinking I should change the regulator U3 to a 5v regulator. perhaps the UA78M05CDYR. What do you think?

Mouser and Digikey are UK friendly except for the postage. But I will have to bite the bullet....

U3 (8Volts) provides bias to U5 .... and is DC blocked from U2 and U7 .....

U6 which controls the switching of U2 and U7 is powered from 5Volts ....

no regulator change needed ... i dont think.

Hi Mike,

Yes, I did get a UHF SDR, and got fairly well into the build although my old microcontroller board barfed and I have not got off my lazy rear to start with a new one yet. Unfortunately I did not get far with answering my original questions below, but I appreciate that they didn't fall on entirely deaf ears! :-) I do at least know that the oscillator works properly and moves around as-programmed!!

Still would love a direct-to-USB option rather than dealing with the control board and the sound card, which would be somewhat easier (or at least less lossy/noisy) to do with those kicad files. ;-)

What prompts your question?

Happy Easter, by the way, to all who celebrate that!

Im using a sound card with a QRP2000 ....

only using the soundcard option because i know of no MCU based solution
that can modulate/demod FM ....

My set up right now is an Odroid-X2 Arm computer with a soundcard and
QRP2000 usb controller for the Si570 ....

I have a manualy switched in 2M bandpass filter now so i can now listen
with better resolution and of corse full hf ....

I plan on making it remote controlled for VHF and use a CA2818C for RF
to ~800mW(hope for 1W) --

The OdroidX ahd some useable GPIO pins thatcan be used for control lines
via an level converter ....

this is what i'm trying to do these days ....

What prompted my question was just wonderong how your were getting along
with VHF/UHF/SHF .....

From: g.suggate@...
Topic: 1913 Message: 1923

Thanks to all who responded. I ordered MMG3H21NT1 (to replace the HMC482) and UA78M05CDCYR (to replace the 8v reg) from Mouser. I have now fitted them and was greeted with loads of instability on TX. I looked at the spec sheet for the MMG3H21NT1 and note they suggest 0 ohm instead of the 27 ohm. This did not help. I then went back to an 8v supply and a 27 ohm resistor, just as bad. I also have a 150 ohm resistor in parallel with the inductance feeding the MMIC. Has anybody managed to tame this chip ?? Any suggestions gratefully received.

Mike,

How much voltage? Have you pulled the line cables and checked for voltage with them disconnected? You could be seeing something from the soundcard/computer with a ground loop.

Mike,

I would suggest that you connect a 5 to 10K resistor from each of the four signal lines to ground. Then make your voltage measurements.

If your previous measurements were made with a high input impedance voltmeter, you would probably see about 2.5VDC on the rig side of each of the capacitors and something less than that on the computer (sound card) side. With the resistors added as suggested above, you should see a much smaller DC voltage on the sound card side.

The capacitors probably have a very small leakage, and with a high impedance voltmeter, you will see some DC with nothing connected but the voltmeter. The load resistors would likely reduce the DC on the sound card side of the caps to millivolts.

Hope this helps.

1933. CW OFFSET CARRIER from uhfsdr board

Yahoo group: UHFSDR
Date: 2015-06-03 16:40:07 UTC
From: g.suggate@...
Topic: 1933 Message: 1933

Hi Guys,

I wonder if anybody can give me a pointer to the following:-

Looking at the input to the TX MMIC under key up conditions I get a signal 750hz away and only 20db down on the main carrier. On key down this signal disappears and the main carrier appears on the intended frequency, but only 20db stronger. When this is fed to the amplifiers this condition is easily audible to others.

I have noted that the o/p of the UHFSDR board is very low under key down (around 3mw) and have checked the TX MMIC which is giving 12db gain. So have now started to think that the mixers are not being driven hard enough. I am only able to do comparative tests, which show the same input level on both sides (pins 1 and 6) of both mixers. I borrowed a scope a few weeks ago and confirmed the phasing is correct.

I would be very grateful for a set of readings taken with a scope giving the expected levels into the mixers and perhaps further back along the drive chains to enable me to sort out this problem. Once I have some figures I will borrow the scope again. Or any clues as to what might be the cause...

Dave,

Thank you for your response.

The RX is OK except that strong signals (above S9 +5) produce spikes all over the band.

There is virtually no loss through U2 so I am happy that is OK.

As the levels into the mixers(ie Q,/Q,I,/I) measured against ground, are all the same and the phasing is correct, should I now try replacing the mixers

as they hardly seem to be balancing out the carrier at all. ie with no Audio I and Q input the o/p is only 20 db

down. Am I correct in assuming it should be approaching the -57db level as per the mixer spec?

Geoff:
Sounds like possibly a mixer problem. Check that the resister values in the 3dB attenuators in the LO path are correct. Note also that neither LO pin is grounded. The 2 pins are driven by the in phase and 180 degree outputs of the dividers.

1937. VHF modification

Yahoo group: UHFSDR
Date: 2015-06-18 16:00:05 UTC
From: Mike
Topic: 1937 Message: 1937

Hey guys/gals ....

This question is for those that have changes out the first amp in the Rx chain (U4) -- with what i don't remember right now --

Im wondering how that is going ... is it still stable?

Iv been using the 2m band of late and it strikes me that the original needs help in that area --- i dont seem to have enuff gain -- or more said, signal to noise

and since i did buy a replacement U4 (to replace the BGA612) .....

I cant remember if it was advised to replace R3(120ohm) or just set the choke on top of it .....

i bought and have retuned a PROCOM DPF2/6LH-24-30 that seems to be working quite nicely .... its installed (temp) and

as soon is i figure out where in the heck i placed (hid - sure hope i didn't throw them away) 2@BGY36's ill be Txing with ~30W on 2meters ....

Check out my modification on the LNA within the conversation text.

Regards
GM3SBC.

Ps you may find that you need to sign an end user licence to procure the genuine part. The performance is just too good for some countries to have availability. As a matter of interest I also can no longer get access to the component and I live in the UK. There has been a severe tightening up of the distribution of this part.

Never mind .. found message 714 ...

And i think i bought 2 shortly after you posted that ... and the inductors ....

ok .. so how has it been .. still working .....

Did you leave it with R3 as a 100nH ? or did you try some swamping resistance ?

Or im not sure if (i found my previous posts --wow im forgetful) ... series a 100nf with a 560nf .... would help on DC bands ...

Id sure love to see a pic of the new mmic installed !!!!

1941. frequency control

Yahoo group: UHFSDR
Date: 2015-06-18 18:38:07 UTC
From: edfinn11@...
Topic: 1941 Message: 1941

Hello,

I have a uhfsdr that I never tried to use. I want to change that!

I was looking at the UHF2SDR board, but Christos is no longer making them. Is there anything else out there to make a clean interface and decent CW performance?

I do not have a way to control the SI570 now without gutting my softrock rx/tx. Is there a solution for this piece? I want to use power-sdr.

thanks,
Ed wa3drc

Sorry .. yes that's a typo ....

100nH to 560nH ...

i see that a 100nH was used for test fixture for 400Mhz to 3Ghz .....

the QRP200 uss's almost the same firmware as the softrock ....

you will not have band pass filter control with it .. but Si570 will be controlled ....

Iv been planning of using Alex Lee pic32 code of the same .... but with more control lines for 6M, 2M, 1.25 and 70cm .... some day.

Im currently using a QRP2000 to control the si570 in my uhfsdr ...

I now sell a USB2I2C board. It will plug into H1 on the UHFSDR. It has the same firmware as the Softrocks. It does work in power-sdr.

It is right above the UHFSDR on the For Sale page. It is actual
called USBI2C.

OK .... so change out is done ....

I did screen shots on 80M (3.970mhz) with a calibrate signal that's part of my Atlas350xl --- its nice and steady.

and 2M (147.38Mhz) its a semi local repeater ...

before and after -- with antenna connected and without ...

On 80M i lost 20DB of signal and also went down 10db of noise floor ....

on VHF 2M 147.38mhz i gained 10db of signal but had no difference in noise floor with antenna on or off ..... i assume that this was due to using the 2m throw on antenna that on the HF vertical ... its a mfj1798 if anyone wants to look it up ....

I had an issue of my stupid local AM Broadcast station getting into the radio after the change over was done .... not sure if its due to the higher gain or what but it mostly seen on HF .... might be also that i happen to start before 11pm and finished after ... i dont know when they increase/decrease the transmitted power ....

iv lived with the signal on my case grounds for 7 years now and im sure it will go away when I MOVE !!!!!

Whom ever has done this change out with the spf5043 --- does it run almost hot .....??

I might of damaged it from a stupid mistake when starting ....

Mike:
If you are only using the 560nH choke, that value is too small below
10 MHz. Add a 3.3 uH or so in series with the 560nH. At 4 MHz, the
560nH is only 14 ohms which will load down the 50 ohm output.
The 3.3uH at 145MHz will likely look like a capacitor.

I only used the 100nH ....

The gain just kept going up in the pdf ....

Also I thought that a loss of gain might be ok in the hf area ..

I'll add a 560nH or a 3.3uH .... Should get the coil before next week end .... I hope.

I figure one step at a time ....

Since I'm not trying to rx anything above 2.4ghz ..... would you like to see the next choke replacing the 100nh or put in series?

Mike:

  If you are only using the 560nH choke, that value is too small below 10 MHz. Add a 3.3 uH or so in series with the 560nH. At 4 MHz, the 560nH is only 14 ohms which will load down the 50 ohm output.

  The 3.3uH at 145MHz will likely look like a capacitor.

Ps you may find that you need to sign an end user licence to procure the genuine part. The performance is just too good for some countries to have availability. As a matter of interest I also can no longer get access to the component and I live in the UK. There has been a severe tightening up of the distribution of this part.

Im still looking for an answer ....

does the spf5043 run kinda hot durring normal operation? it gets hotter
than my Si570 does .....

any one see the same thing ?

1957. spf5043 pics

Yahoo group: UHFSDR
Date: 2015-06-22 03:28:07 UTC
From: Mike
Topic: 1957 Message: 1957

this looks poor .. and im thinking of removing the 3.3uH in series with 100nH with a single 560uH ... but

this is what i have working right now ....

I was looking to see if you can do more than 40khz of split with Quisk in the 2M band when i came across some people talking on 144.47Mhz ....

Im not sure thats supposed to be used for FM simplex .. but ....

i did use them to make some observations ....

the weakest signal fellah was 70% copy .. and the strong guy was 100% ....

I decided to switch the coax to my HT for a comparison ....

The week fellah was 80% -- lots of broken/chop .... and the strong guy was full winky blink on the HTX-202 ....

now i figure the UHFSDR is doing alright .... it can't compare to a true FM detector receiver ...

i might still want to change out the series chokes for a single 560uH .... not sure what would be a good compromise ... IF compromise was needed ....

pic of the giant install .... https://flic.kr/p/uHZnJh

i sapose i should photobucket ... that link looks like its secured and im not sure if you can remove the "s" from https to see it ...

let me know

Now .. im going to use the same thread ...

has anyone used the commet brand duplexer's as band pass filters ?

Iv not had any luck finding a 1.25M filter for sale but commet does sell
a duplexer that seperates 220Mhz from 440and HF (170Mhz ..)

at better than 40db isolation and low loss ... ".6db" i think i read
....

any thoughts ?

Dave,

I got the ATTiny85 board today, thanks.

This does not have a keyer built into the firmware right? What is the significance of CWKEY_1 and CWKEY_2 lines?

When you use them it sets a flag ...

this in turn is read by the software -- if its been written to use this
feature -
to send a dit or dah in the sdr program (PC) ....

it kinda has some delay ... and annoying to listen to when you send a
word and you hear the word 4 seconds or more after .... depends on latency.

ok, i forgot how this worked. I recall the long delay trying to send cw with a softrock rx/tx. it was annoying over 10 wpm as i recall. i guess i could get a picokeyer and listen to the sidetone.

i guess flexradio must do something different. I was using flex 1500's at w3ccx during the June contest a couple weeks ago. they had two stations using that radio on the microwave bands as IF's. Their CW lag was undetectable to me at 20 wpm.

I want to use uhfsdr as my microwave IF. CW is mandatory for microwaves!

Ed

From: Mike
Topic: 1941 Message: 1963

Yea .. that's what i have done .... pluss the memory keyer is helpful ....

i used it into the audio line that way .... i don't hear the delay its alot shorter ..,,,,,, than ....

trying to get your action through the USB, then computer making the tone, then you hearing it .. you can see why its got a bit of a delay using the paddle ports on the USB2i2C .... it can work .. but not the best.

Im still wondering what UHFSDR users are using for filters above 2M ..... i wonder if those comet triplexers have enough isolation to be compliant ...

I even found a quad and penta plexer made by Austin antenna -- no longer in production.

With the >40db isolation and using 50ohm loads on the un-used ports ... i wonder if that could provide enough harmonic suppression to be FFC legal ....

lets face it .. the uhfsdr can produce quite the harmonic output without filters .... which i think is a good thing ....

It would be fun to use the UHFSDR on 902mhz or even 1.2Ghz --- 2.4Ghz ?

NO5K posted some plots of a UHFSDR that main carrier was on 28Mhz and 17th harmonic on 478Mhz only 30db down ...

I wonder what the harmonic levels are if the si570 was set to a desired freq of 144Mhz ... or even 440Mhz ... or higher !!!!! would the 17th harmonic still be 30db down ? (7.511428571429Ghz 30db down?) .... would it be usable ?

Wish some one would do more spectrum plots !!!!

The 5th harmonic (140Mhz) of the 28Mhz plot was 14db down ...

Set main to 300.666666667Mhz .... 3rd harmonic is 902Mhz @ 9db down ....?

Set main to 280.0000Mhz .... 5rd harmonic is 1.2Ghz @ 14db down ?

Seth main to 691.2Mhz ..... 15th Harmonic is 10.368Ghz ..... (ok so im sure that the MMIC and Tx amp's cant go that high ...?)

Am i ranting
Am i WAY off base ?
Would the I/Q phase error be insanely bad ?

well, the first thing I will try is 144 mHz. I tuned a small helical filter today that I got from DEM for 144mHz. It had about 2 db loss, but its just an IF. the next problem would be a 432 mHz filter which will be the IF for my 24 gHz transverter. I can probably do that with a helical filter too. Switching these will be another problem that I haven't figured out yet.

You are trying to do direct I/O though. Since I already have transverters with 144 IF's, it's much easier. Actually, these boards are cheap enough that you could dedicate one to a band. Then you would have to figure out audio and usb switching...

now I'm drifting off in a different direction!

Mike,

I am not sure... I assembled this in the summer of 2012. I looked under a microscope at U4. It was not obvious as there was not enough contrast. Why do you ask?

The project is in high gear. I have an enclosure, and was drilling metal all night...

I have a high quality USB sound card that I was using with the softrock. It is a EMU Tracker Pre. It does 192kbs. I hope it works with powersdr. I guess I'll find out soon...

Because the noise would be better and would have more than 15db more gain ....

The spf5043 has a noise figure of .8db at 900mhz and the BGA612 2.1dbNF@2ghz -- has shown its self to be fairly deaf for some reason on 100Mhz and higher ...

It helped boost my Rx levels by 10db and drop my noise level a few db ...

Im using a simple 16bit USB soundcard @48Khz ....

i think i uploaded some pics ... of mine with the spf5043 installed ....

I am not sure how Flexradio does CW. openHPSDR/ANAN rigs implement CW in the FPGA but I have seen reports of delays. I haven't looked at how the keyer interfaces with the radio hardware.

HiQSDR has direct inputs to the FPGA from the keyer. Listening to the audio oscillator in my old Curtis 8044 iambic Keyer and from the radio on another receiver there is no perceptible delay at ~40 WPM with the RX/TX relay chattering away in unison.

Its what i had ....

Its because the HF gain degragates because of the 100nH ... as i understand it , it has a Xl of 1.1ohms @ 1.8Mhz
@ 1.9Mhz the 3.3uH is 40 ohms .....

the test jig that they show is tested from 400Mhz to 3Ghz .... we don't need that high of a performance .... maybe ?

I was just trying to increase the HF gain some more (or reduce the loss from such a low impedance)
... but not alot since the spf5043 has more gain than the 612 .... and you don't need alot of gain on 160M !!!

when i added the 3.3uH i lost about 3db of signal on 2M, not sure how much on 440Mhz .. i dont have a filter yet for that band and didn't want to Tx (bring up a repeater for Rx comparison ---- before and after screen capture with same soundcard levels)

Some one needs to experiment with values .... i don't think the UHFSDR can Rx/Tx much above 1.2Ghz .. i might be wrong .... (really wish some one would set the Si570 to 650Mhz (800Mhz/2) or so and see just how much power is in the 3rd through to the 15th harmonic ....

Id love to see 2.4Ghz or more ... even 10mW would do ....) i think) ....

Iv not done much microwave stuff ... but i do have 7 Internet satellite dish set up's .. one of wich i think was on 26Ghz ... the rest were 11-12Ghz .... (10.368Ghz anyone?) --- plans for the future -- hope to try before i die ...

The 3.3uH would dominate at lower frequencies. But, 140 MHz is above the resonate frequency of almost all 3.3 uH coils. The coil will act more like a capacitor at that frequency. The 560 nH is not enough inductance below 10 MHz. The test board is designed for VHF.

Ok .. so the hmc482 can hit 5Ghz

... seen its power out at +22dbm(Datasheets360) ....

I wonder if the top end could benefit from a 100nH in series with the 560nH (L1) .... or 56nH ... they list several chokes for various frequency's .... all the way to 5Ghz with a 5.6uH ...

humm .. they also use a 100pF for DC blocking on the input and out ...

wonder if a 100pF paralleled with C9 & C16 might help with near microwave bands ... 900mhz and 1.2/2.4Ghz ....

see .. its late and im going off dreaming again .....

1976. Driving UHFSDR from USB2SDR

Yahoo group: UHFSDR
Date: 2015-06-27 19:26:00 UTC
From: g.suggate@...
Topic: 1976 Message: 1976

For some time I have been having trouble with low o/p from the UHFSDR board. Having checked everything else I am wondering if I am getting sufficient I/Q drive on TX from the USB2SDR board. (I wonder what it is supposed to be?). I notice that SV1EIA designed a separate amp board to boost these signals, but I have never seen any reference to it being used.

So my query- Has anybody had to boost the I/Q drive when using a USB2SDR card and did it increase the o/p. (my o/p at the moment is only a few milli watts). I also have a problem with what appears to be leaking carrier which is about 600hz away from the main carrier and only 20dB down. My thought now is if I could increase the I/Q level this would improve this difference between the leaking carrier (which does not come from the I/Q) and the main carrier.

Thanks in advance

Geoff G3NPI Buckingham UK

Finally made a purchase ....

Went with the RA60H1317M1A .... saposed to be able to run it class C or AB ...

Does anyone have voltage levels for the gate to be close to linear?

All i know is that it will be some where between 4.5V and 5V (thats what i take away from the PDF)

Im not sure if all newer fet modules can be ran in a linear mode .... but i figured ill run 60W FM and if i get 40W SSB .. thats good enuff for now ....

If i need more power... ill build a GS-35B based 2M amp to hit around 2kw .... (but i doubt ill do that)

Im planning on re-tro fitting a 200W CB amp i have --- for the heatsink .. and a old police 60W 2M(close to) amp for its relays and such ....

I don't have an exact answer for you but mini-kits out of Australia sells
support boards for that exact RF module and other things I've bought from
them have worked.

You would have to monitor the drain current and adjust the bias until
you get the no-signal desired drain current. Due to slight variations
between devices, the vaotage will be close, but small differences make a
big difference in drain current.

W6pql has a board for some of the Mitsubishi modules. Don't know if it works with that module but he has lots of amp stuff you would probably be interested in. The bias circuit for the 80w 2m amp might work though it's for a toshiba amp.

http://www.w6pql.com/parts_i_can_provide.htm

One lesson I learned on using one of the Vhf modules is the gain on some of these modules is very high. You must use quality relays to isolate the input and output otherwise you get a mighty fine oscillator and ended up toasting the module.

From: Mike
Topic: 1988 Message: 1988

So .. just a slight update ...

just found and bought a 100W low pass filter ebay 252007720325 .... to go along with a RA60H1317M1A that just arrived yesterday ....

was going to use a BPF that i have ... but i didn't exactly want to seperate the 6 cavities into a pair of 3 ....

I was going to use this configuration .... radio ---> 3cavity BPF -----> RA60H1317 ----> 3cavity BPF ----> coax to antenna
********** relay for Rx ******

now only the amp and lowpass filter will be on a RF relay ..... 6cavity BPF will be inline all the time ...

Well i came across this and couldn't resist ...

ebay ,,, 131372178363

populated board and its less than what you can buy from RfParts (bare)

1992. replacement hardware_usb.py for Quisk

Yahoo group: UHFSDR
Date: 2015-07-13 02:56:45 UTC
From: Mike
Topic: 1992 Message: 1992

If any one wants to use quisk with a UHFSDR that has a Class "A" Si570 thats using a PE0FKO type emulated or AVR

i have uploaded a replacement hardware_usb.py that belongs in the quisk/softrock folder ....

i don't know why the previous code lines are not being used with my PE0FKO V15.15 AVR thats in quisk .... but this is what worked for me ...

YMMV

1993. spectrum analysed

Yahoo group: UHFSDR
Date: 2015-07-13 15:48:31 UTC
From: Mike
Topic: 1993 Message: 1993

This week i will be taking my UHFSDR to my local VHF club Tech and will be using a spectrum analyser to look at my harmonic content when my Si570 is set to its max freq ..... 708.5Mhz ... im hoping to get a screen capture on the spectrum out to the 15th harmonic .... or what ever it can do

Mike,
To do what you hope to accomplish, you need a 12GHz(10.6275GHz) spectrum analyzer. That's an expensive piece of equipment.
Why do you need to look that high?

Just curious,
Jean-Paul

dont need to ... want to ... and this guy im going over to used to work for Agilent as an RF engineer .... the analyser is a 24Ghz thing ...

Im thinking that the rolloff above 4ghz will be severe .... but some one has to look to know.

10Ghz with out a transverter would be nice ... but i dont think thats possible ....

Mike,you could use the SI570 to generate the LO for the 10GHz band. If the square wave is perfectly formed, the 15th harmonic is only 24dB below the fundamental. So you can add an amp and a filter to drive a down-mixer.
Just my $0.02.73 de Jean-PaulAC9GH

Mike:
You would also need to change mixers on the UHFSDR. The ADE-2ASK is rated to 1 GHz(don't know how much higher it might go). Minicircuits does have other higher freq. mixers with the same pin-out.

The best one i could find with the same case and schematic layout was
the ade-30w ... 5mhz to 4ghz ...

Topic: 2003 Message: 2003

Has any seen a sweep of a 1/2 wave bandpass filter ?

http://www.k3pgp.org/432filter.htm

its quite the low loss ....

From: <Patriot121@...>
Topic: 2004 Message: 2004

Ok ... just got done having my uhfsdr looked at with a 24ghz spectrum analyzer.

My out put was less than 1mW on 708mhz and on 440mhz looked like some serious FM modulation or was breaking into oscillation.

Perhaps L1 should be modified to use the original 560nH wirh a 100nf in series ... as was done with R3, or my hmc482 is damaged ...

Thoughts?

OK .... did the tomb stone with the 560uH and a 100nH ....

Still looks like it is breaking into oscillation in the 70cm band ....

148Mhz looks good still .... i need to finish my 2M amp as soon as the parts get here and re-assemble my dummy load onto another heat sink -- (im going to use the one i took the 50ohm 100W load off of for the 60w 2M amp)

Guess i need to buy a replacement HMC482 and try to get this sorted out ....

Any one reading the board have one for sale?

What was the output and what frequency span did you check?

HF or UHF ?

My**HMC482 seem to break into oscillation (durring Tx) around 200Mhz or
so ....

Topic: 810 Message: 2010

Ok ...

Well im a bit confused at teh moment ...

I should of tested hf and 70cm for each change ....

at first i couldn't find a 470 ohm resistor ... so i started with a 1K and figured if i didn't see a change that i could drop another on (1K / 2 = 500 ohm)

Didn't see a change on 70cm Tx oscillation so i went on to adding another 1k .... of corse now im wishing after all is done for the nite that i had tested hf before moving on

with 500ohm across L1, 70cm seemed to tame down and not throw trash .... went to the highest area of my scanner could go that the UHFSDR matched ... 512Mhz .... hit the Tx and ... no dice.

ok ... i figure ill go still lower in value that i have on hand 330 ohm ... still no 512Mhz , so i figure ill pull the 330 out and take some more time looking for my other SMD parts bag.

I figure ok, i can live with not much above 70cm for now .... so i check 80M ... no power, then 40 and the 10m ... nothin.

pull out the 330 ohm and root around for a while untill i find the bag with my 2nd stash of SMD resistors. Get the 470 ohm installed across L1 and check 450Mhz ... its ok .... still no 512Mhz and hf is split for working. 40M works but nothin on 75M ...

I figure its late and ill post so far what i have done .... and maybe some one will respond that has gone in front of me.

what does it take to get the MHC482 to operate higher in freq .... i would like 708.5Mhz and 160M .... but right now im hopeing that 160M to 70cm is possible with the right selection of parts ...

Perhaps leave the 560uH but replace the 100nH with a 3.3uH like is listed as an alternative .....

making for a 470 ohm resistor in parallel with a (560uH in series with a 3.3uH) ....

what sounds like a corse of action to you Dave? ---- i do kinda wonder if the hmc482 was damaged when U4 and U7 quit at about the same time ... hard to remember ..

Mike:
I don't have any resistor across L1. I have 3.3uH in series with 560 nH. I did see a UHF oscillation, on U5, but only during receive. I think that was very early before R1 and R2. Putting a 100 ohm resister across the output tamed the oscillation(apparently it didn't like operating with no load).
The highest frequency I have operated the UHFSDR(receive only) is UHF TV channel 59. Didn't have test equipment to check at a higher freq. at the time. The 560nH by itself caused low output below 10 MHz, but not zero.

2013. Re: [UHFSDR] Re: The Oscillating PA

Yahoo group: UHFSDR
Date: 2015-07-21 20:25:59 UTC
From: Mike
Topic: 810 Message: 2013

Im using a Uniden sport turbo scanner -- its only FM .... it does not
cover from 513Mhz &up in the same segments that the UHFSDR should do ....

If i tune the UHFSDR and the scanner to the same frequency ... the
scanner will pick up the leakage of the Rx .... Si570 is working ok

If i tune the UHFSDR up or down 10Khz, its far enough away that the
scanner will not "hear" the leakage on Rx ....

If i Key the SDR software tuned to the same freq as the scanner is tuned
to and i hear my self -- i figure its not oscillating out of controll

but if its just hash that breaks the squelch of the turbo scanner then i
figure that U5 is oscillating out of control ....

Do you think the next best thing to try to use is a 3.3uH in series with
a 100nH and place a 100ohm resistor (330 i do have) on the output of U5
or after the blocking cap C16. Using test point 5 to ground looks like a
good spot ... use the corner stud of the RF connector for ground connection.

Mike:
That sounds right with the scanner. I noticed the oscillation originally because it wiped out a UHF TV translater I was watching on a nearby TV. The 560nH has too low of impedance below 10 MHz and the 3.3uH at 500 MHz is well above its self resonance and likely looks like a capacitor. That's why the two together. I put the 100 ohm from the mmic output to ground. I think taming mmics is magic.

From: Mike
Topic: 810 Message: 2015

looks like success ....

Placed a huge (compared to the 100nH) 3.3uH in series with a 100nH for L1. Then used a 470ohm from TP5 to the corner of J4 (the one closest to U3). Had to bridge the gap from the 470 ohm to ground with a piece of solid wire ...

Tested on 75M and 2M, 1.25M and 70cm .... all A ok .....

Also checked 512Mhz ... as that's as high as my scanner and UHFSDR have in common still no sign of Trash from the Tx.

I probably should take a picture and post it to the forum's pics ....

2016. packet radio sound modem

Yahoo group: UHFSDR
Date: 2015-07-22 04:37:24 UTC
From: Patriot121@...
Topic: 2016 Message: 2016

Any one know of a pack radio sound modem under linux/ubuntu ?

Iv used psk31 and a few other sound digital modes ... but now that my UHFSDR is working on VHF id like to get packet radio working with it.

Neither - it's a sound card modem. Audio data packets in - computer data packets out. You would use it with the Linux AX25 tools such as axlisten or call to do basic packet stuff. Beyond that you can do everything for BBS's, APRS to even TCP on ax25.

UZ7HO soundcard modem has a nice GUI but it's a windows program.

Yea .. and Wine does not work on Arm systems yet ....

thats why im looking for a gui for packet ... i have soundmodem working
and direwolf too ....

Im not interested in ARPS .... just want to use some thing similar to
the old baycom stuff ....

Look for LinPac at sourceforge - if it ever comes back. Here's a start:

2025. VHF amp

Yahoo group: UHFSDR
Date: 2015-08-06 21:39:07 UTC
From: Mike
Topic: 2025 Message: 2025

IF any one is following me on this ...

Im about to test this RA30 amp control board ebay 301524834961 with a RA60 ....

Im not sure how much power is needed by the RF detector and id rather remotely activate Tx condition ....

I soldered some brass nuts for 4-40 bolts onto the pcb .... (and drilled out the thread so that my 4-40 would pass through- before hand !!!)

the PCB didn't look like to could sit flat on the heatsink. My nuts are abit too thick and i had to bend the RA60 pins up some .... didn't sound like any broke from the board .... hope they never do ...

The RF detector looks like a generic type .... im just not sure if pulling the base of the relay control transistor high (3V?) will activate or grounding it.

Guess ill soon know.

Preview by Yahoo

Need to make a few modes ... the Rf detector takes way too much power ....

AND get this ... the Bias is not controlled by the Rf detector .... if you set the bias to draw 5A through the RA60 ... your buringing power all the time .... not good.

Since im going to control the Tx/Tx switching from my SDR ... guess a addition of another relay to switch on/off the bias is going to be in order ....

Thats the next project for the amp as of this writing ...

Oh output is now 40W with bias at 4.45V

John:
Order the UHFSDR PCB and the UHFSDR minikit from my for-sale page.
Download the Digikey parts list and upload to Digikey(if in the USA) or
the Farnell spreadsheet if in Europe to order the remainder of the parts
except for the Si570. The Si570 can be ordered from the Silabs
website. Get the LVPECL output option. If you wish to control the
UHFSDR by USB order the USB2IC board.

Welcome !!!!

I ask what bands do you plan on using the UHFSDR on ??

So far iv used mine on HF VHF, but not UHF yet ....

There are a few mods to consider for L1 and R3 ... replacements
depending on where you wish to operate or try to cover full Si570 range.

Im still trying to use FULL coverage ... and my last mod has left me
with not enough power for 10M .... i might change L1 (has been replaced
with a 2diferent value chokes) again ... most likely ... lol

So the addition of a really old 12V spdt was added .... it was so old that when i searched for the pinout .. all i could find was "discontinued" -- turns out it has a NC AND a NO pin set ....

Looks rough but its working ....

Ran the voltage up to 16V and got 55W out ... so i figure one of two things are going on .....
Im not giving enough drive (most likely) to reach 80W or the low pass filter is heating ...

But either way ... i left the bias at 4.45V it gives me just under 40W out and SSB seems to be about the same ... i need to find the case to this old CB linear -- im getting RF feedback on SSB now ....

Mike:
? We are OK but have been at the shelter in Kooskia since Friday night. ?Was able to go to the house and pick up some more items. ?Yesterday afternoon a lot of water drops helped a lot. ?They were afraid the fire would crest the ridge about 1/2 mile from my house. ?My neighbor who is a rancher with 690 acres and heavy equipment plus the firefighters bulldozed fire breaks and set some backfires. According to todays map, the fire has retreated a little. ?Power has been off at the house since Friday night with no estimate for its return. ?Too many poles down and transformers burned. My XYL(KF7LGL) heard on the scanner(actualy an IC-208H in the car) that a reporter was being taken up to our ridge to view the burnout. ?But, don't know from what station.
? Just heard the fire as reached the ridge and trees are on fire.

Hey .. is this "Broadband Conical Inductors" from coil craft something new .. or been around for a while ?

Just got an add from them and was wondering if it would help with output on the UHFSDR .... or is just hype.

Chuck ... do you have the 1.4ghz Si570?

right now i can do most HF (6M is unknown) 2M ... verified power on
220Mhz and 440Mhz (up to 512Mhz) as of this writing ...

I built a 2M amp and hope to have parts for 1.25M and 70cm ....

This is with 3 different choke values in series for output ... and the
5054 front end change ...

Hello Sid and Mike,

Please find OnGraphData() in quisk.py and replace it with this. It is at lines 1969 to 1988 in Quisk 3.7.6:
def OnGraphData(self, data, y_zero, y_scale): sample_rate = int(self.sample_rate * self.zoom) #T('graph start') row = '' # Make a new row of pixels for a one-line image gain = self.rf_gain for x in data: # x is -130 to 0, or so (dB) l = int((x - gain + y_zero // 3 + 100) * y_scale / 10) l = max(l, 0) l = min(l, 255) row = row + "%c%c%c%c" % (chr(self.red[l]), chr(self.green[l]), chr(self.blue[l]), chr(255)) #T('graph string') # Perhaps use 4-byte pixels and BitmapFromBufferRGBA() bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row) bmp.x_origin = int(float(self.VFO) / sample_rate * self.data_width + 0.5) self.bitmaps.insert(0, bmp) del self.bitmaps[-1] #self.ScrollWindow(0, 1, None) #self.Refresh(False, (0, 0, self.graph_width, self.top_size + self.margin)) self.Refresh(False) #T('graph end')
This is the whole function, but only two lines have changed:
row = row + "%c%c%c%c" % (chr(self.red[l]), chr(self.green[l]), chr(self.blue[l]), chr(255))

bmp = wx.BitmapFromBufferRGBA(len(row) // 4, 1, row)

If it works I will move it to Quisk.

2060. Signal Levels in completed UHFSDR

Yahoo group: UHFSDR
Date: 2015-09-18 09:39:51 UTC
From: g.suggate@...
Topic: 2060 Message: 2060

I have been investigating a signal leakage problem round the mixers for some time now and have recently acquired a dual beam scope. So have been comparing the readings with those given in the assembly instructions. Unfortunately I think the assembly instruction readings are taken without the mixers fitted.
Can someone please give me the following from a working UHFSDR board. Freq set to 5 mhz

Level at TP8 and TP9. I read 0.5 v p-p
Levels at U18 Pin 7 and 6 also U17 Pin 7 and 6. I read 0.5 v p-p
Levels at U16 Pins 1 and 6 also U15 Pins 1 and 6. I read 0.2 v p-p

From the spec sheets for the DBMs, it seems the LO drive should be approaching 7dbm so 0.2 v p-p is way too low. I have checked the resistor values in the quadrature chains and these are OK.

I note the comment on the SDR2_IQGEN schematic which says "Pick for best match to DBM" and have tried reducing the 10 ohm value, but this only gave a marginal increase in level at the DBMs.

Thank you in anticipation

Geoff G3NPI

That's also fixed the issue on ODROID-U3/Hermes-Lite and Raspberry Pi 2/HiQSDR for me using quisk-3.7.6.

HiQSDR standalone with 7 inch touchscreen is excellent and I am thinking of using Hermes-Lite standalone also with a 7 inch touchscreen to make a small portable/mobile station.
73 ... Sid.

From: MIKE DURKIN
Topic: 2060 Message: 2062

i think the audio drive is much higher than the signal from the Si570 chain ...

I could get the reading from mine either today or by middle of next week ....

Side note .. my output from my UHFSDR on 146.58Mhz was 19dbm ...

Which Si570 are you using ?

Geoff:
U16 pins 1 and 6 are driven by a differential signal not referenced to ground. They are 180 degrees out of phase with each other. That gives you .4 V P-P between the two pins. Sounds a little low. How are you measuring it? It is a square wave and most multimeters will not read the P-P correctly. If using a scope the best is to use 2 channels and subtract them. As I recall, I saw about .8V difference between the two pins.

From: g.suggate@...
Topic: 2060 Message: 2064

Hello Mike

When you are taking the readings I would appreciate the audio side levels as well. Although the fault I have, (a signal only 15 db down and off-set by the CW tone setting, getting through the mixers) is present even with no input on the audio side. Your figure of 19dbm o/p from the UHFSDR card is very interesting. My o/p has always been low at 2dbm (maybe a manifestation of the same fault?).

The Si 570 I use is the AAA000514G. From its spec sheet I decided that was a LVPECL and applied alternative resistor values as in SDR2_IQGEN.sch. I did wonder about this, but decided that as the Flip/flops
were switching that it was probably was OK....

Hello Dave

I have only just acquired a dual beam scope so not very used to its facilities.
I am measuring 0.2v p-p from U16-1 to ground. If I connect the second channel to U16-6 to ground then I also see 0.2v p-p 180 deg out of phase. The scope also has an ADD button but that does not change the display.
It also uses CHOP so perhaps not a great scope!
I have been considering what might cause low o/p from both the flip/flops and having checked the resistor chain to see if it was loading them and replacing the DBMs the only thing left is the flip/flops but they both give the same o/p which seems unlikely? Any thoughts?

Thank you both for your quick replies. Much appreciated

Geoff G3NPI

I have done a few more tests and it seems the flip/flops will not produce enough volts p-p, even with the load disconnected. The most I can get is 0.8v p-p {from each o/p to earth} and that was after changing the pull down resistors from 300 to 180 ohms. I still do not know if this low o/p is the fault, seems a bit unlikely as they both give the same o/p, but if it is SY10EP25 are not easy to obtain in the UK. Does anybody know of a replacement item...

Geoff:
Those FF are LVPECL. 0.8V p-p for each output to ground(1.6V P-P between the 2 outputs) is right on spec for LVPECL. Also, it is referenced to 2V rather than ground. The divider circuit with the 300 ohm set the 2V center point.

Dave

Thank you for putting me back on the straight and narrow. I have put the 300ohm resistors back. That is the trouble with poke and hope. However doing nothing is not an option as the UHFSDR is unusable at the moment
I will have a look at increasing the level of the audio side as I am using a USB2SDR and have not met anybody else using that combination. Unfortunately this will be poke and hope as I do not know what the levels should be in a completed unit that is working well

I recently received strip line filters from Jim WA2EUJ (HobbyPc) ... they were prototype filters ....

The difficulty was about the same if not a bit easyer than building the UHFSDR .....

I hand soldered all the pads. Then wicked them, placed some flux on the pads and stuck the surface mount surface parts onto the board. Popped into my toaster oven and WA-Lah, done. How simple is that?

Jim has already designed a second generation of those filters and sent me the plots/sweeps of those ... I just posted them to the photo album area.

Now if some one could design a switching board for the filters .. that would be great !!!! Im going to kludge together some relay to do it ....

Hope to get them in the mail soon , so i can get them built and on the air !!!!

From: MIKE DURKIN
Topic: 2074 Message: 2074

Just throwing it out there .....

Don't know if any one is interested but iv decided to sell my PROCOM DPF2/6LH-24-30 its been tuned to the 2M band ....

Its rated for 60W and i have run 50W through it ....

Id like 50$ for it plus shipping ....

Ill help anyone with building an amp for 2M that buys it ...

Forgot to mention that the ferrite loaded choke from (jesh i forget) works from 160m to top of as far as Quisk can go .... 512Mhz.

for some reason 10M quit and i think its due to my bandpass filter that original to the radio -- probably been damaged. Its also will be replaced with Daves bandpass board sooner or later.

From: MIKE DURKIN
Topic: 2082 Message: 2082

Are you saying that apon each reboot ... that the phase/gain adjustment was different .... or that you couldn't achieve a image rejection ?

I can null the image to the point that i cant see it (48Khz@16bit -- i cant get 24bit to work) .... but im not sure when the phase/gain changes .... either apon each reboot -- or does it change if i remove the usb card too ....

I need to take some time to investigate some more .... my Quad core Arm USB bus is about maxed out as far as data goes ....

Im starting to wonder if the crystal on the soundcard is of low quality

or my Si570 does not have the same phase error each time its booted -- simple fix is to constantly power the Si570 ....

>Does any one else use the SD-AUD20101 usb soundcard ....??

>If so .. are you having a shift in Rx phase / gain each time you boot ?

I tried my one recently.

And realised why it had got to the bottom of my junk box.

I found phasing was impossible at 48ksps, did work at 96ksps but varied widely over the spectrum.

>What software and OS are you using ?

W10 and HDSDR but I did try it on XP earlier and wondered what was wrong. In all cases just using the default Windows driver.

Mike:
I have only used it with windows. I would think the only place the gain could change is the soundcard as the audio amps in the UHFSDR have fixed resistors for the gain. The Si570 should not affect the phase as the 2 outputs are 180 degrees apart from a common point. The flip flops generate the I and Q and they are digital. If it is in the soundcard, it should be the same on HF and VHF. I noticed a little more phase error on 70cm, but still got about 30 dB opposite sideband rejection before having the program correct the phase. But, stayed stable. A high resistance or rosin joint somewhere?

I have used UHFSDR on our 70mhz band (does this count as VHF!!) for several years in conjunction with a USB2SDR. I have experienced problems which I have yet to solve. Namely: Images on incoming strong signals and on transmit, a carrier only 20dbm down.
I watch your discussion with interest as I suppose phase change could be a contributor to the image problem.
I am intending to increase the o/p of the USB2SDR to hopefully tackle the carrier problem.

Topic: 2084 Message: 2089

Im not sure what "o/p" is ....

Iv never had an issue with not being able to null the Image .... (my problem is that the phase/gain keeps changing some)

after the recent upgrade of the Rx amp (u4) i get products with strong signals (vhf) .... this upgrade has greatly increased the VHF/UHF reception while degrading the HF some ....

How much power are you getting out of your UHFSDR ...

What are you using for bandpass filters in the UHF/VHF area ?

Hi Dave

Many years ago, I tried – in vain- to buy some devices directly from SiLabs. But not recently. S&H fees where… astronomic. It still is a problem for some hard to find references (for ex. Shipping of the the Si510 used in the Hermes Lite project cost twice the price of the device and is sold only by US distributors)

By chance, it is really easy to find Si570 here in Europe. Jan G0BBL got an impressive stock in UK (Cmos, LVDS and CML)
http://www.sdr-kits.net/Webshop/index.php?cPath=7&osCsid=18r6llrhsd3untk56k0ririnc7

His webshop is running for many years and his customer service is really serious. All UHFSDR and Softrock I've build so far are using silabs oscillator coming from SDR-Kits.

Hope it will help
73'

Objet : [UHFSDR] Si570 European sources

Anyone know where in Europe the LVPECL or LVDS versions of the Si570 are available? Anyone outside the USA tried to order from the SiLabs website?

Hi All,
Using the UHFSDR design, to get good and stable image performance you must have a consistent 50 percent duty cycle on the output of the Si570. If you look at the specification of the Si570 I think you shall find that there is a large tolerance on the output. ie , It is not a square wave.

Have you noticed any image rejection shifts after a reboot of the hardware....
In the Phase/gain of a frequency that has already been calibrated?

I cant test with my old soundcard right now .... im updating my SDR with a 1.25M and 70cm amplifier ..

I would have to check.
I thought the UHFSDR calls for si570A LVPECL.
That's what I used on my 2 UHFSDR boards.

Your definitely right, Sid.
The only AAA device I have was coming from a kit delivered by Art. My other rigs are using DBA and CAC devices without trouble
As Jan is already a regular customer of Silabs, a "group buy" for a specific reference could be feasible.

Hi Marc,
I had bad experiences with the Silabs samples.
Both were faulty - one died after a month and the second was DOA.
Another one donated by GI1SET was also.

The first one that worked was one donated by George Boudreau.

Hi Sid

I feel sorry, still my rotten English :-(
I didn't meant "sample" when I was mentioning Jan. He is considered as a regular customer and a normal and official retailer (not a real "distributor", but neither a "grey market reseller"). That means I'm pretty sure he is able to buy quantities of AAA grade Silab components directly from the manufacturer if (and it is an important detail) if the demand is high enough. That means at least a group-buy of 10 people I think, probably more.

All the devices I bought from SDR-Kit have been fully functional (and still are... I have a certain talent to transform ICs in blue smoke, but by chance, I never fried a SI570)

73' and season's greatings :- D

Guys,

I have known Jan for 20 plus years and occasionally help out beta testing SDR-kits products. I am quite happy to approach him if you want something he does not stock. He buys parts directly from Si Labs and as well as supplying hams supplies commercial companies.

I have soldered Si570s many times, removed them from boards and reused them. I have not destroyed one yet.

Regards,

Steve G0XAR

Topic: 2092 Message: 2103

Hi Marc,
No problem with your English.
I understood they were ones you bought from SDR-Kits.

I think the free samples were the ones that didn't quite make the spec.
No problems with the C samples for Softrock, just with the A samples
for the UHFSDR.
73 ... Sid.

2104. Re: [UHFSDR] Si570 European sources

Yahoo group: UHFSDR
Date: 2015-12-25 22:08:18 UTC
From: Sid Boyce
Topic: 2092 Message: 2104

Hi Steve,
As I pointed out to Marc, only the si570A samples from SiLabs were a problem and I think the the free samples were devices not meeting the spec.

Neither the free C samples nor the bought full spec'd A devices have ever failed.
73 ... Sid.

Hi Sid,

No problem. As I recall Jan had a lot of trouble getting Si Labs to supply him at the start, when we were multibanding softrocks which must have been almost ten years ago.

Regards,

Steve

2106. RE: [UHFSDR] Si570 European sources

Yahoo group: UHFSDR
Date: 2015-12-26 07:16:16 UTC
From: Marc OLANIE
Topic: 2092 Message: 2106

Hi

At least, I understood the confusion. My fault

When I was mentioning the “A” letter, it was the technology (cmos, ecl etc) / temperature class/frequency range suffix. When Art began to ship his first UHFSDR kits, all oscillators where AAA grade component (LVPECS, 50 ppm, 1.4 gigs), bought directly to Silabs (no sample).

Marc

2107. Free Si570's

Yahoo group: UHFSDR
Date: 2015-12-29 23:25:46 UTC
From: dave@...
Topic: 2107 Message: 2107

I checked the SiLabs website earlier and found that they are now offering free samples of the Si570. You get 2 samples of each part number. I ordered 2 grade A LVPECL and 2 grade B LVPECL. I am interested in seeing if the 810 MHz can be raised closer to 900 to permit use of 70cm.
I also checked the online prices for ordering and had a pleasant shock. The grade A was $105+ each, they are now $46.65. Digikey also has a limited selection.

Dave - WB6DHW

Dave:
Where on their site do you get samples? I found data sheets, etc. but
no opportunity for samples.
Thanks,

Jim:
The Si570 configuration page is at
<http://www.silabs.com/products/clocksoscillators/pages/oscillator-part-configure.aspx?PartNumber=Si570>
Once you fill in your specifications and enter your name, address, etc, you will see buttons for "sample and "online order". If you hit the "sample" button, you get 2 free samples. If you hit the "online order" button, you can order any quantity and pay for them. Note you do have to have pop ups enabled to get to the cart page and check out.

Topic: 2107 Message: 2111

damn ... 46$ for a grade A

iv recently found out that the Hughes net internet sat dishes use a 900Mhz-2.1Ghz Lo ... for 10.7 to 12.75Ghz (with switched 9.75 and 10.6Ghz oscillator) ...

Almost an easy get on 10.695 if you have a BPF for 10.695. Use the UHFSDR on its highest freq or its 3rd harmonic (not sure yet) ...

Glen, did this go direct to you ?

It should of been to the group, worse ... i dong know which group you were part of ... sorry

Its for VHF/UHF ....

I can make one for 1.25M so far .. but 70cm has eluded me ....

I have an ARRL and antenna book from 1995 .... don't remember there being values for 70cm lowpass filter ...

Its been so long that iv even lost the CD that came with it .... and hte hard drive that its copy was on crashed SOOOOMMMMMEEEE time ago ... lol.

but anyways .... i have a lowpass for 2M, need to get parts for 1.25M and looking for part values for 70cm.

I was going to make a lowpass with PCB pads for 70cm, but all the PCB's material i have are lossy at those freq and power level.

I don't know what you are trying to filter or why, but a low pass filter for RF is nothing more than some caps and coils you can wind yourself. All of it in closed in a box. Any ARRL handbook has instructions for building them.
Example attached.

Same as Mike.
Where UHFSDR differs from softrock is the divide by 2 instead of by 4.
This script needs to be run once. It sets up per-band divisor.
I don't know if USB2SDR needs it.

2119. Si570

Yahoo group: UHFSDR
Date: 2016-02-02 09:37:39 UTC
From: dombaines@...
Topic: 170 Message: 2119

Returned to this after a while and find in the parts bag 2 Si570 marked BAB000107DG (got two UHFSDR to build)

Not sure but I THINK from notes these are...

LVDS 50ppm 10-810MHz startup 107MHz versions

P32 of the Si570 spec sheet seems to confirm this.

An obvious question could these be used in the UHFSDR as opposed to the ABA000514G and what differences might I expect?

I want to use on 432MHz/70cm so not 100% these could be used.

Dom

2120. Re: [UHFSDR] Si570

From: Dave
Topic: 170 Message: 2120

Dom:
You are almost all correct. I looked up the part number on the Silab site. The startup freq is 10 MHz. The LVDS will work on the UHFSDR. The I/Q generator sheet has the resister values needed in the interface circuit between the Si570 and the flip flops. If the freq. range only goes to 810 MHz, then the UHFSDR will only go to 405 MHz. But, I think someone else has got a "B" speed device to go high enough to cover 70 cm. Let me know the result when you get it going. With 10 MHz startup, you should hear WWV at 5 MHz without any programming.
Silabs is now offering free samples of the Si570. I got 2 of the "A" grade LVPECL output last week.

From: MIKE DURKIN
Topic: 170 Message: 2122

Dont bother with the clas B Si570 .. get a Class A from SisLabs ... they are free sampled again.

You could cover with out gaps till 472.5Mhz .... then gap till 485Mhz to 567Mhz, then another gap till 606.5Mhz to 708.75Mhz ...

Which you could use with a transverter to 10Ghz ... but on a 5th harmonic and a HughesNet satellite setup --- i think. I have the equipment, just not tried yet ---- Kinda slow in that regards and if the First amateur radio in geosynchronous orbit gets put up .. you know ill get it finished !!!!

Hi Sid,

I was looking at your script, and wondered why do you have lines from 0 to 8 (9lines), instead of 0-7 (8 lines).

Is there a specific reason for the last line?

Just curious,
Jean-Paul

2124. Re: [UHFSDR] Quisk and UHFSDR

Yahoo group: UHFSDR
Date: 2016-02-03 01:54:48 UTC
From: Sid Boyce
Topic: 2114 Message: 2124

This was done in the heat of battle when Alex and I were trying to sort
out the multipliers needed for the UHFSDR.

With the default divide by 4 we got some strange frequencies.

Alex supplied new SDR-Widget firmware which took divide by 4 but
interpreted it as divide by 2 to send to the si570.
Then we discovered per-band multipliers were needed to stop bands
defaulting to divide by 4.

As there were no pre-selector filters installed, it didn't matter.

Thanks, Sid.

That make sense. It is too bad that the SDR-WIdget kind of faded away.
I miss that time.

2126. Re: [UHFSDR] Quisk and UHFSDR

Yahoo group: UHFSDR
Date: 2016-02-03 12:32:11 UTC
From: Sid Boyce
Topic: 2114 Message: 2126

Hi Jean-Paul,
Hopes were high to begin with but the typical Softrock guys never really
got interested and still aren't interested in anything that KB9YIG
doesn't supply.

Around the middle of last year Tony asked for suggestions on what the
Softrock group would like next. I suggested he contact Steve Haynal
about Hermes-Lite as Steve really didn't want to get into the business
of kit production - he still has a day job.
As usual there was no response to my suggestion - the only one as far as
I can remember, so Softrock is still the only product.

The SR63ng, the Mobo and the SDR-Widget all suffered the same fate.
73 ... Sid.

Topic: 2114 Message: 2127

Sid et al,

I find it interesting to see where things are going. I have also did a progression;

A couple of Tony's kits
Mobo/Widget
SDR2GO
STM32SDR
and now Hermes-Lite

Although I contributed to the code a bit on the STM32SDR, I haven't dug into the Hermes-Lite coding for lack of skills, but perhaps someday. For now, I am content with hardware fiddling. Dave Miller recently shared some of his thoughts on the future of the STM32-SDR project in that group. I believe he sees the future also in the Hermes-Lite fork and I certainly agree based on the early performance of my rig. Currently I am in a side channel working on a Scotty's Spectrum Build so I can fiddle with hardware in a more disciplined way. Honestly, other than the early thrills of radio, circa 1961, there isn't a more interesting time to build stuff.

Hi,

I seem to have almost doubled up on all components after checking Farnell and Digikey orders as building mine up. Anyone looking for a set of parts? This does not include the PCB or the components in the minikit (see the fies for the Farnell BOM)

The weight should be almost nothing so a small jiffy bag at most.

I am in UK so probably better if in EU but send to US and elsewhere can be done too.

Costs... what the parts cost me plus the postage.

From: dombaines@...
Topic: 170 Message: 2131

Just arrived... got to say though, nice they have but talk about packing overkill a 12" x 8" x10" box, containing another slightly smaller box, that contained another one (I see the package bounced about in Si before being sent to me)... with a silver foil 'humidity pack' in it. I was beginning to think it was one of those kids games ... pass the parcel.

All for 2 Si570 that would fit on a postage stamp... and even that foil pack would have fit in a simple jiffy bag!

Still I have them now.

Tnx to all for the suggestion.

I'll drop Si a note to say what they were used in and how it is doing.

2132. Si570 leakage when in Tx

Yahoo group: UHFSDR
Date: 2016-02-22 20:24:04 UTC
From: MIKE DURKIN
Topic: 2132 Message: 2132

Has anyone measured their Si570 leakage when Tx'ing? on VHF anyways ?

I was using a rtl-sdr with gqrx to set my sideband suppression and my leakage on Tx was around 20db below my output ....

The sidband suppression looked better than 70db ....

I was not measuring this value during Rx .... my leakage from the UHFSDR board is only about a few db's above the local noise ..... some day ill put the top case on.

2133. Re: Si570 leakage when in Tx

Yahoo group: UHFSDR
Date: 2016-02-23 13:52:22 UTC
From: g.suggate@...
Topic: 2132 Message: 2133

Hello Mike,

I have been trying to fix the carrier leakage problem for over a year now. I seem to have replaced most bits but not the Si570. As nobody else seemed to have the same problem (carrier leakage) I thought that as I am using the USB2SDR interface, perhaps I was not getting enough drive from the USB2SDR and was going to make building a high precision amp my next job. Now it seems that will not fix it either.....

My other problem is lack of o/p on vhf (about 1 mW) which I had put down to the same lack of drive.

I had previously been using the system for a couple of years direct on 70mhz amplifying it to 150w output until
I got the report of carrier leakage. Now it sits in the corner awaiting my next move

Good luck. I will be interested to see if its a faulty Si570 or are they all like that?

From: MIKE DURKIN
Topic: 2132 Message: 2134

Seems like you have done more testing than me ?

What are you using for a SDR program ....

What is the larger I/Q error ? we cant do much about the phase error --- unless there is a clever way to lay a piece of wire over a Q trace or I traces to effect delay ... after the I/Q transformer is the only place that i can think of as a place to load I/Q for amplitude balance ... but it will also imbalance phase too ...

Hope Dave has an idea ....

On VHF .. im getting 15mW out measured on a Tektronix 2Ghz spectrum analyser ... i used a loaded choke on the output amp "T" to improve output flatness from HF to 512Mhz. Before the change output would drop off significantly around 100mhz ....

The choke was From CoilCraft, and im fairly sure i listed the part number in previous emails to the board. Im sorry to also say that i did not try the second candidate i got from coilcraft because the first work so well -- i said "thats good enough" ---

Have you made modifications to the Rx path and Tx paths? Iv also done the Rx amp modification for Better (much) for VHF .... its almost too much gain (or probably is) with slightly reduced gain on 160M.

Iv built a VHF (2M) amp with a RA60H1317M1A module and can achieve 80W with 14.5V on the amp. If any one is wondering thats reading this --- i used a PCB form Ebay called "Power amplifier FOR interphone hand Taiwan" that states for 440Mhz in most auctions ... it needs a modification to switch PA bias on/off, else it heats up some.

Geoff and Mike:
The mixers are the largest determiners of the carrier leakage. The ADE-2 specs for LO leakage are quite good. Either one of the mixers is bad or there is a path around the mixers for the LO signal. If there is output at the correct frequency from the flip flops, then the Sii570 is OK.

On 2m and above ... I had to increase the amplitude error from a max of 10 to 20 and is about 14 to null image ....

Wouldn't one of the flip/flops going bad and a Mixer going bad have the same effect? -- as well as a dirty board .... mine has been uncovered for ... well, just too long.

I guess swapping flip/flops would be a straight forward test .... then the mixers, and in each case if the amplitude error goes from a -14 to a positive 14 -- of the set that was switched, one would be suspect?

Im thinking that Si570 output level has only a marginal effect on phase error and no effect on amplitude error.

Also i admit that amplitude error might also be soundcard related.....

Dave .. ummm .. well probably a better question to ask Jim (of Quisk) does the SDR program control the balance of the soundcard gain levels or only the levels calculated and sent to soundcard stream.

Im sure Sid Boyce is also reading this ... i think he has a UHFSDR too (i could be wrong) ...

Mike:
One of the flip flops going bad would cause the opposite sideband rejection to be 0. If one mixer had more loss then the I and Q amplitudes would be different. I would think a dirty board could provide a path around the mixer for the LO. The 2 LO pins are driven differentially rather than one gong to ground. So, each will have likely several hundred ohms resistance to ground.
You could try swapping the audio leads from the sound card to see if the amplitude goes from -14 to +14.
The amplitude of the Si570 outputs will not affect the I and Q amplitude as long as the flip flops are triggering. If the 2 Si570 outputs are not 180 degrees apart(very unlikely), then the I and Q phase would be affected. If the phase error increases with frequency, then the 2 paths are no the same. I tried hard to make the RF paths the same. There is a little difference in the audio path, but 1 degree at audio is a lot of length.
I don't know what Quisk does. But Windows(and Linux I think) have controls for each channel. Don't know if the software overrides these.
On the carrier feedthrough, does the software put the LO on the transmit frequency, or is it offset a few kilohertz as is common in receive?

Sounds like the most likely source is the mixers then for me .... ill try unplugging/plugging the cable from the soundcard to see if it changes the amplitude error. and also cleaning the PCB, though i remember melting the side of one of the mixers when making an mod ... seemed ok but might of been damaged.

Iv soldered the audio cables to the UHFSDR PCB .... iv also replaced the Tx capacitors the the connectors due to a failure ... i should get new to make sure they have the same values.

Software i use can move the Rx/Tx audio up to 24Khz away (limited to +/-24Khz because of soundcard) from the Lo ....

Subject: Re: [UHFSDR] Re: Si570 leakage when in Tx

Mike:

One of the flip flops going bad would cause the opposite sideband rejection to be 0. If one mixer had more loss then the I and Q amplitudes would be different. I would think a dirty board could provide a path around the mixer for the LO. The 2 LO pins are driven differentially rather than one gong to ground. So, each will have likely several hundred ohms resistance to ground.

You could try swapping the audio leads from the sound card to see if the amplitude goes from -14 to +14.

The amplitude of the Si570 outputs will not affect the I and Q amplitude as long as the flip flops are triggering. If the 2 Si570 outputs are not 180 degrees apart(very unlikely), then the I and Q phase would be affected. If the phase error increases with frequency, then the 2 paths are no the same. I tried hard to make the RF paths the same. There is a little difference in the audio path, but 1 degree at audio is a lot of length.

I don't know what Quisk does. But Windows(and Linux I think) have controls for each channel. Don't know if the software overrides these.

On the carrier feedthrough, does the software put the LO on the transmit frequency, or is it offset a few kilohertz as is common in receive?

On 2/23/2016 3:35 PM, MIKE DURKIN Patriot121@... [UHFSDR] wrote:

On 2m and above ... I had to increase the amplitude error from a max of 10 to 20 and is about 14 to null image ....

Wouldn't one of the flip/flops going bad and a Mixer going bad have the same effect? -- as well as a dirty board .... mine has been uncovered for ... well, just too long.

I guess swapping flip/flops would be a straight forward test .... then the mixers, and in each case if the amplitude error goes from a -14 to a positive 14 -- of the set that was switched, one would be suspect?

Im thinking that Si570 output level has only a marginal effect on phase error and no effect on amplitude error.

Also i admit that amplitude error might also be soundcard related.....

Dave .. ummm .. well probably a better question to ask Jim (of Quisk) does the SDR program control the balance of the soundcard gain levels or only the levels calculated and sent to soundcard stream.

Im sure Sid Boyce is also reading this ... i think he has a UHFSDR too (i could be wrong) ...

Subject: Re: [UHFSDR] Re: Si570 leakage when in Tx

Geoff and Mike:

The mixers are the largest determiners of the carrier leakage. The ADE-2 specs for LO leakage are quite good. Either one of the mixers is bad or there is a path around the mixers for the LO signal. If there is output at the correct frequency from the flip flops, then the Sii570 is OK.

Dave - WB6DHW

Hello Mike,

I have been trying to fix the carrier leakage problem for over a year now. I seem to have replaced most bits but not the Si570. As nobody else seemed to have the same problem (carrier leakage) I thought that as I am using the USB2SDR interface, perhaps I was not getting enough drive from the USB2SDR and was going to make building a high precision amp my next job. Now it seems that will not fix it either.....

My other problem is lack of o/p on vhf (about 1 mW) which I had put down to the same lack of drive.

I had previously been using the system for a couple of years direct on 70mhz amplifying it to 150w output until

I got the report of carrier leakage. Now it sits in the corner awaiting my next move

Good luck. I will be interested to see if its a faulty Si570 or are they all like that?

Mike and Dave,

I changed the mixers some time ago (difficult to do !), and it made no difference.

I checked the I and Q paths and they appeared correct. (Scope has packed up so can not do that again)

I did the TX mod but did not see a great difference. But my o/p is much lower than yours anyway.

I have always used a preamp combined with a bpf so had enough RX gain.

The program I use is PowerSDR-IQ v1.19.3.2.0 This is a special version developed by Christos for use
with the USB2SDR. I do not think other versions work with USB2SDR, although I have not tried.

I now have an ANAN 10 which is my current station, but I look forward to getting the UHFSDR working again
using SDR directly on VHF is still unusual and you can not beat using a homebrew rig. I used to get many compliments on the quality of the audio from the UHFSDR.

From: MIKE DURKIN
Topic: 2140 Message: 2140

I Hear by rescind my endorsement of any Via 1620a USB based soundcard ....

Though its fine for Rx @ 96Khz .... and cheap, but

Its output Phase error and moderate amplitude error makes it horrible for Tx ....

I thought i had developed a fault with my UHFSDR for the last 2 months .... even unhooked my DIY amps to investigate (i thought they were the problem originally)

This all might be an impedance issue that Lief has pointed to .... but im not sure ....

Leif used T pads to reduce the input to the opamps and provide a purely resistive load for the soundcard output opamps (if they had one) .... I would solely would use a precision SMD resistor for left/right channels and try that out in the future ...

After swapping back in my ole' CM106 based USB soundcard ... things went back to normal (good and stable) values for image rejection ...

Mike:
Good information. I was planning on using those USB soundcards for a stand alone version of the UHFSDR with a Raspberry PI replacing the computer. Want to use the PI Zero, but they have been out of stock since the first day offered in November.
On transmit, have you tried a lower rate(48KHz or 24 KHz)?
Is the old CM106 based USB card still being sold?

Yea .. the old CM106 based USB card is still found on Ebay .. thats where i got mine ....

ebay 400852410469 .. this one has a metal (aluminium) case .. it does not say it in the listing, but looks like a clone of a clone of a clone of the CM106 ....

i did get this backwards .... yes the Phase was above -19.98 (%???) but i changed the amplitude/phase allowable variance to 30 (this was in quisk) and amplitude was +23 for the Via ...

I dont know how far off the phase is ... its allowable variance did not change form 20 ...

Put the CM106 in and set phase/amplitude and its ---
phase -.014 and amplitude was +4.2 on 2M .... dont remember what it was on 440 ....

I need to bug Jim(of quisk) about +/- of the Lo and the difference in amplitude error ...

When i set the phase/amplitude and then not changing the Lo but setting Rx/Tx to the same freq that the opposite side band was ... the image rejection is not still really really good ....

My set up went from around 80db difference (in the noise floor) to 60db ... i would think as long as the Lo was not changed the image rejection should not change too ....

So i was going to ask that 2 different saved phase/ampli error for a checked freq be stored ... one for (+IF) + Lo and one for (-IF) + Lo ....

Linrad sweeps the whole +/- and records what ever the user wanted ... 12Khz 24Kz 96Khz ....

Huge amounts of out of band noise.
That is why on the STM32-SDR I added a low pass filter to clean things up.
It's requirement was well hidden in the data sheet.

What passband bandwidth? If I recall it was in the 20 KHz area. For TX you don't need a wideband signal. If I recall I did some testing with decent Chinese 2 channel arbitrary waveform generator and spectrum analyzer and after I added the low pass filter on the STM32-SDR with uses a TI TLV320AIC3204 there was no decernable difference in noise between the STM32-SDR and the Waveform generator. It been a couple of years ago when I did that testing but I have some spectrum plots in a report I did. I direct email to me will prompt me to find what data I might have.

From: edfinn11@...
Topic: 2151 Message: 2151

after procrastinating for years, I want to get this running for a microwave IF on 144mhz.

what software is easiest to test this out? I think I want to use powersdr, although I recall there may be a better variant for this type of board...

I also need to control the si570. I have the wb6dhw usb/i2c board too.

I have a creative emu tracker-pre that I can set to 192kbps. My si-570 defaults to 288.200 mHz., so this could be a secondary goal to bring this up.

What is the best way to continue?

tnx,
Ed wa3drc

Ed:
The best is

PowerSDR v2.4 for Homemade SDR transceivers

They have a Yahoo group. Actually, any of the SDR programs that will control a Softrock will work if you can select a divide by 2 LO. These programs also control the Si570 via the wb6dhw usbi2 board. If your Si570 defaults to 288.200, then the UHFSDR will be on 144.05.

using windows 10 64 bit here...

I decided to try powersdr v2.4.4 . I have it installed with the "overlays" and drivers.

I've been clicking around and it is not obvious where to tell this s/w that the sampling frequency needs to be 2x. Where is this set?

tnx,

Has anybody successfully run UHFSDR with an ODROID as the processor? If so, can you share details like the SDR program and installation?

I ask because I just saw an announcement for an Odroid C2 with quad core, 64-bit, 2GB of memory, for Forty One Dollars!

Thanks & 73,
Jim

There is a Quad 64 from PineApple ...Pine64

Thoughcost sounds about the same .. i wonder what quad is going to be offered by Odroid ...

I use ubuntu(lubuntu) and Quisk4 with my UHFSDR. A QRP2000 as Si570 controller and sooner or later will use gpio through python to control the hf/VHF and UHF filters ....

Also using a Via1620A(actually its a 1630) usb soundcard ... I AM NOT USING THE ONBOARD sound .... it is still WAY laggy for some reason ....but should try again since there have been pulse audio improvements with Quisk and Ubuntu.

The Odroid i use is a -X2. Quad arm7(was it 9) -- Mali400 is not supported.

Just more noise ....

the pine64 is a quad a53 core with a dual Mali400 ..(mali being worthless as far as i know)

Im not sure if there is going to be a performance boost over the -X2, but surely use less power ... 1.2Ghz pin64 and 1.8Ghz -X2(xynos4412 32bit)

Thought its kinda funny .. my touch screen uses more power than my -X2 does anyways !!!!

http://www.hardkernel.com/main/products/prdt_info.php?g_code=G145457216438
for the specs and comparison with -C1+ and -XU4.

Waiting for the Pine A64+ to arrive and shortly the ODROID-C2 should arrive.
From the specs the -C2 is 2GHz vs the A64+ 1.2GHz and triple-core
faster Mali vs dual-core Mali.

Only question is whether the available Linux distros will be 64-bit or
32-bit.

Ok .... im fairly sure that i have the most recent kernel and all updates in ....

Im still not getting radio audio to the on-board speakers jack ....

Even tested the audio path with some music (that did work) ..... Quisk simply does not like the huge latency values for the onboard sound.

At least for the odroid-X2 ... Quisk and the on-board sound still does not work -- with any SDR program iv tried.

The Odroid-C2 might be different -- but plan on using 2 USB soundcards ....

Subject: [UHFSDR] UHFSDR
Sensitivity Improvement

Hello All you UHFSDR lovers,

I decided to do some further
measurements of the MDS on my
UHFSDR.

I started by measuring the UHFSDR
unmodified in the following set up
conditions:

Software: WRplus

PC: AS! PIRE One Net book

Signal Generator: HP with additional
Microwave attenuators.

Mode : CW

Frequency: 144.300 Mhz

Bandwidth: 500Hz

AGC:Off

The result for 1 dB signal above
noise power : -133dBm.

I then decided to change U4 (BGA612) to a different type of MMIC, the SPF5043Z. This is a 50 Mhz to 4 Ghz part with high dynamic range. It has a lo! wer noise figure and higher gain than the BGA612.

The mod was simple, remove the BGA612, install the SPF5043Z taking care to check the different orientation and replace R3 (120 ohm)with a 100nH Inductor.

The result for 1 dB signal above noise power : -145dBm

So if you want a super sensitive VHF/UHF front end, you got it !

Only possible down side is that the IC starts to degrade below 50 Mhz. It could still be adequate for the DC bands if you really must use the UHFSDR for that purpose.

What a remarkable little radio this is.

Regards

Ed GM3SBC

Mike:
I would like to see what you are getting.

I took a quick look at data sheet: OIP3 of 33 dBm, gain of 20 db
suggest bad things start happening around 13 dBm (20 mW) input.

One other thing to consider: With 20db preamp gain, might the mixer, or
post-mixer amp be getting driven into non-linearity?

An easy option would be a single cavity filter, tuned for the center of
the weak-signal area you want. Based on my experience sweeping
band-pass/band-reject cavities in repeater duplexers, you can put a
-40db notch about anywhere you want. If you only have a band-pass
cavity, I'd expect at least 20 db rejection 2 MHz away.

Good luck and stay in touch!!

Jim

From: MIKE DURKIN
Topic: 1100 Message: 2165

I dont know how much signal im getting to the input from the repeater ....

I wonder if i damaged the SPF5043Z when installing ....

I need a known power/signal source .... and i do know where to borrow one at .... i think.

Ill post a pic in the files section later .... its not soundcard overdrive , i don't think, i can reduce soundcard gain quite low and high and same effect ....

Im not getting intermod, but products from too much signal i think .... using a 2M bandpass too , so you know.

Mike:

I would like to see what you are getting.

I took a quick look at data sheet: OIP3 of 33 dBm, gain of 20 db
suggest bad things start happening around 13 dBm (20 mW) input.

One other thing to consider: With 20db preamp gain, might the
mixer, or post-mixer amp be getting driven into non-linearity?

An easy option would be a single cavity filter, tuned for the center
of the weak-signal area you want. Based on my experience sweeping
band-pass/band-reject cavities in repeater duplexers, you can put a
-40db notch about anywhere you want. If you only have a band-pass
cavity, I'd expect at least 20 db rejection 2 MHz away.

Good luck and stay in touch!!

Subject:
[UHFSDR] UHFSDR
Sensitivity
Improvement

Hello All you UHFSDR
lovers,

I decided to do some
further measurements of
the MDS on my UHFSDR.

I started by measuring
the UHFSDR unmodified in
the following set up
conditions:

Software: WRplus

PC: AS! PIRE One Net
book

Signal Generator: HP
with additional
Microwave attenuators.

Mode : CW

Frequency: 144.300 Mhz

Bandwidth: 500Hz

AGC:Off

The result for 1 dB
signal above noise power
: -133dBm.

I then decided to change
U4 (BGA612) to a
different type of MMIC,
the SPF5043Z. This is a
50 Mhz to 4 Ghz part
with high dynamic range.
It has a lo! wer noise
figure and higher gain
than the BGA612.

The mod was simple,
remove the BGA612,
install the SPF5043Z
taking care to check the
different orientation
and replace R3 (120 ohm
)with a 100nH Inductor.

The result for 1 dB
signal above noise power
: -145dBm

So if you want a super
sensitive VHF/UHF front
end, you got it !

Only possible down side
is that the IC starts to
degrade below 50 Mhz. It
could still be adequate
for the DC bands if you
really must use the
UHFSDR for that purpose.

What a remarkable little
radio this is.

Found that a MFJ-259b ....

The output into 50 ohms is about 7 dBm when properly aligned with fully charged batteries.

So it must be damaged ... the 259b with just a pigtail does the same thing ....

Good information. I was planning on using those USB soundcards for a stand alone version of the UHFSDR with a Raspberry PI replacing the computer. Want to use the PI Zero, but they have been out of stock since the first day offered in November.
On transmit, have you tried a lower rate(48KHz or 24 KHz)?
Is the old CM106 based USB card still being sold?

There is a specific version of V 2.4.4 which is configured for X 2 LO on the PowerSDR-IQ forum.

From: MIKE DURKIN
Topic: 2140 Message: 2172

Ok .. when you try out the 1620 ... let me know if you had to set time delay for channel offset or not ...

Iv been having a change in settings from time to time with mine and im not sure if its a driver issue or overload on the USB bus ...

Some times my DisplayLink USB display does not come up too .... so im leaning twards a system overload here ...

Also what are the maximum settings you managed to acheive ... 24bit or 16 //// 48Khz or 196Khz ... (once tired)

I can set 196k but only 16bit for all bandwidths ....

Also i have a spur or something 20khz out from center (vfo spike) -- on both sides .... need to investigate if its a product from the soundcard (1620) or mixers.

As i change the Lo setting all products from mixers should move in frequency 2X or more right?

Also im going to try adding a 20ohm resister on left and right to ground to see if there is any effect, probably tacked across C31 & C30 ...

Ramblings and wonderings today .....

adding the 20ohm resistors to C30 & C31 was terrible ....

as audio drive was 50% alot of harmonics were seen .....

What is the input voltage for audio expected to reach opamp limit of the UHFSDR (U9)?

Mike:
Haven't done that calculation before. I don't think the op amp is
the limiting item. It is set up for a gain of 2. The VCC is 5VDC, so
the input must be below +- 1.25V before limiting. The FST3257 will also
limit at about the same as it is a 5V device. The IF input of the DBM
will, I think, limit at or before +_1.4V, which neglecting loses would
correspond to +_.7 volts at the op amp input. Too much input will be
obvious as it will flattop and produce harmonics of the audio.
Just checked the ADE-2ADK data sheet and the 1dB compression for the
RF and IF inputs is +1dBm. If my math is correct, this is .25V RMS(?)
in a 50 ohm system.

Who with info ...

As far as iv seen ... it depends on the filter in it and the oscillator to know what input to use ... I think it's in the range of 888mhz to 1.4ghz

I checked the SiLabs website earlier and found that they are now offering free samples of the Si570. You get 2 samples of each part number. I ordered 2 grade A LVPECL and 2 grade B LVPECL. I am interested in seeing if the 810 MHz can be raised closer to 900 to permit use of 70cm.
I also checked the online prices for ordering and had a pleasant shock. The grade A was $105+ each, they are now $46.65. Digikey also has a limited selection.

2182. New Build

Yahoo group: UHFSDR
Date: 2016-05-31 21:26:22 UTC
From: lists@...
Topic: 2182 Message: 2182

I have been lurking here for a few years and considering buying a PCB/mini kit the whole time. I broke down and finally bought them today. I'm looking over the BOM. A few of questions:

Is the download on the site the latest or should I be looking elsewhere?

Any updated part numbers and/or outdated parts that I'll have a tough time finding?

I didn't see the Si570 version spec'ed in the BOM. Can anyone confirm the correct part?

Thanks!
Jason KE4NYV

From: MIKE DURKIN
Topic: 2182 Message: 2183

I think if you get all the parts from SilverFox that he has the grade A 1.4Ghz LVDS -- not 100% sure ...

Otherwise ... there are some changes to the parts if you want to cover Hf through alot higher (not in the BOM) ... i can Tx 160M to 70cm ... no problems ...

except i think i have a bad mixer .. but some day ill get round to that ....

Im planning on changing out the Rx Bias-T (as its called) to increase the gain on VHF ... iv got a cluged mess on there and plan on changing to one part from CoilCraft ....

So i guess the question is .... what do you plan on doing with your UHFSDR ?

Your probably thinking of WB6DHW's site ...

Silverfox used to sell a full kit ... but that was a while ago ...

He should pop up here soon enough .... SilverFox = Alan -W6ARH

I have not finalized my change for VHF/UHF performance .... but looks like if you used the same loaded choke from coilcraft and managed to figure out how to get them placed ... (their kinda long)

I have an overload or impedance mismatch in spectrum issue with my Rx -- the 2 parts that i tomb stoned together -- that i should replace with a part from CoilCraft , i hope will solve that minor issue ...

Digikey has a min of 1 @ 296-1168-5-ND -- shipping probably insane ...

587-2174-1-ND is a 1uF ceramic capacitor -- just get a mix kit off of ebay .... with the correct size ... valuse can be close, its not all that important -- except for any value in the string from Si570 to the mixers ... paralleled balance must be maintained (well should anyways for UHF)

The 3.3V regulator ... ?? i guess use just about any will work, making sure thats the pins match ....

I doubt that it will be an issue .... ask on the softrock forum too ....

296-1168-5-ND might be a problem ... cant remember where i bought my last replacement -- i bought a few because iv had that go bad twice -- 3rd is doing great. i think i have one left ..... and i think i bought it off of ebay too ... or maybe from Alan, cant remember ... its been good for a few years now ... all accidents (lightning strike near by) ....

First one was terribly microphonic .... second went to lightning .... 3rd been strong ...

>>> Your probably thinking of WB6DHW's site ...

You're correct. That is the site I got the PCB and parts kit from. As for the 587-2174-1-ND, they showed it discontinued, but I could still order what was still in stock.

I found those suitable replacements for the the other two, so I ordered them and I'll give them a shot.

Truth is, I probably already have all of these 0805 passives in stock, but I was just trying to piece together a complete "kit" for myself.

Thanks for the tip so far!

I ended up getting the part spec'ed in the BOM, even though it's discontinued. Looks like it's a 0806 3.3uH. Still need to place an oder for the Si570 (forgot to add it in), so if you have suggested replacements for L1 and L3, I can order them at the same time.

I plan to solder paste and reflow the whole board in one shot, so I would like to have all of the parts I need on hand.

R3 .. not L3 ..

R3 provides bias for the Rx amp U4 ... iv replaced it with a tomb stone 380uH and 3.3uH (i think)

I replaced my L1 a few times but stoped with a part from CoilCraft -- i dont remember what it was but i did post to the forum that i had 2 parts on the way to test out .... one was a loaded choke and the others was a tapered choke ...

But this was so taht i could use it from HF to UHF ... going with the 3.3uH parts probably do fine --

The other reason to change R3 was because of an upgrade for Rx with a spf5043 ...

Topic: 2182 Message: 2194

The parts in the BOM should be correct. However, Mouser and DigiKey
from time to time stop carrying particular parts. The 1uF ceramic cap
is nothing special. Should be a minimum of 16V, 25 is better and is 0805
size.
The LP2992 is a low noise 3.3V regulator. The suffix after the 3.3
indicates a different temp range or different shipping package(tape and
reel, bulk, etc).
Mouser has the SN74CBT3257 in stock for $0.74 for quantity 1. The
Digikey 296-15340-1-ND
<http://www.digikey.com/product-detail/en/texas-instruments/SN74CBT3257CDR/296-15340-1-ND/
569694>
should also work. As long as it is a 3257 in the 16 pin SOIC package.
I recommend the LVPECL output option on the Si570. The speed grade
depends on your max desired operating frequency. Above 400 MHz requires
the "A" grade(1.4GHZ). From 130 MHz to 400 MHz a "B" grade(800 MHz)
will work. Below 130 MHz, any grade will work. The UHFSDR will work
with any of the output option EXCEPT CMOS. Other than LVPECL requires a
change in value of some resisters as noted on schematic.
SiLabs was sending out free samples including "A" speed grade. But,
when I tried last week to order a couple more(they send 2), the cart
showed a minimum order of 50 and not free. But, I was able to order 2
free samples of the "B" grade. It is specified to operate to 800 MHz,
but may go higher(I haven't tried it yet). You must sign up at the
SiLabs website and log in to be able to order the samples. You can also
pay for more Si570's from the Silabs website.

It was a very long time ago admittedly.

The 2 free LVPECL A samples I got, the first died after a month, the second was DOA as was a third free sample sent me by GI1CET.

The first I got working fully was a full spec "A" sent me by George Boudreau.
The second UHFSDR also used a bought si570-A LVPECL.

In summary -- 3 free samples BAD, 2 bought OK.
73 ... Sid.

Dave, Sorry, but I'm a bit confused. You mentioned you "recommend" the LVPECL version, but further down mentioned that the CMOS will not work. So I'm guessing LVPECL is my only option?

So far I'm coming up short on finding the LVPECL 1.4GHz (or even 810 MHZ) version anywhere for sale where you can buy just one. I thought DigiKey had me covered, but they only have the CMOS up to 160 MHz and the LVPECL up to 280 MHz available. Everything else is 50 piece minimum.

I have to admit, I used to be up to date on the Si570 when I was playing with SDR's heavily a few years ago, but now I feel like I have forgotten everything. Relearning this stuff all over is a bitch ;)

As for the other parts, I think i found suitable replacements.

Thanks!

Re: Digikey 587-2174-1-ND

Digikey says that they have 4839 in stock and will sell 1 at a time. I don't know why this is listed as a problem part.

John, I agree according to what you found. However, when I added the part to the BOM on DigiKey, it was flagged as being discontinued and didn't show a suitable replacement. The flip side was, they actually have them in stock and allowed me to order, so I ended up ordering that part in the long run.

Jason:
Other output choices are LVDS and CML. The CMOS does not work
because the I/Q generator utilizes the 2 outputs that are 180 degress
out of phase and the CMOS only has one output.

Digikey has a habit of sending emails alerting customers that parts are obsolete. Yet you can frequently still buy them, and there are plenty in stock! I contacted the manufacturer on a critical part that I use, and they said that the part was readily available and would be for the foreseeable future. So I'm confused. Caveat emptor I suppose.

Yes, I agree and I have seen that with both DigiKey and Mouser.

Well, I have all parts in hand, but I am striking out on an Si570 that will cover the UHF range. Si will not sell me the version I need in single quantity or even sample me one.

Does anyone have any suggestions of where I can get one? Does anyone have an extra they are willing to part with for a fair price?

Thanks!

CML stands for Current Mode Logic. It is a different output drive circuit. It will work on the UHFSDR. The pull-up/down resisters on the output of the Si570 would not be needed and a .1uF cap would couple the signals to the Flip Flops.

If you don't mind, sensitivity can be reduced some ... the 945Mhz Si570 could be used on the 3rd harmonic ....

For FM it might not matter too much ... SSB id go with the CML i guess ... cost comparing all the way ...

I could try my Class A on a 3rd harmonic with a local repeater and see .... the only plot that iv seen is for the class A harmonics -- the 3rd harmonic was 5db down if i remember ... thats about ~1.5 S units lower signal

Do you have any Filters yet?

2223. Si570 and the harmonics testing

Yahoo group: UHFSDR
Date: 2016-09-14 00:58:36 UTC
From: MIKE DURKIN
Topic: 2223 Message: 2223

Does any one have a Si570 class A AND a spectrum analyzer that covers over 15Ghz ?

Id like to know how much signal level is their around 10ghz when si570 is set to its max freq setting ... probably best to set the si570 to 942.545Mhz ... the rest of the range falls outside the ham 10ghz area (i think)

2224. Re: [UHFSDR] Si570 and the harmonics testing

Mike,

The harmonics of a perfect square wave are:

http://mathworld.wolfram.com/images/equations/FourierSeriesSquareWave/NumberedEquation3.gif

proportional to 1/n where n is an odd harmonic, so 9th and 11th harmonics will be stronger than 10th harmonic. So 20 x log10(1/n) = -20 x log10(n). log10(10) = 1, so attenuation will be around 20dB, less for 9th harmonic, more for 11th harmonic.
LVDS swing is 700mV pp, so your harmonics will be around 70mV pp.

Just my $0.02,

From: MIKE DURKIN
Topic: 2223 Message: 2225

yea ,, thats why i went with the 11th harmonic of 942.545Mhz .... the only plot of a spectrum analyzer iv seen is on CliftonLaboratories ... the the Si570 was set to 100mhz with a fair harmonic at 900mhz ...

I want to build a microwave beacon ....

Nope.

You went in the wrong direction.

700mVpp for the square —> 700/11 mV for the 11th Harmonic or 63.636364mV

with the right filter and an amplifier, you get a clean signal.

2228. UHFSDR implementing G3RUH

Yahoo group: UHFSDR
Date: 2016-10-02 22:52:15 UTC
From: ekram67852@...
Topic: 2228 Message: 2228

Hello,

I'm new to radio and I was considering learning more about radio by trying to implement my own setup. I was lucky to find the UHFSDR online. My question is whether the design can be used for a G3RUH modulation scheme. Right now, I see that it works using CW and SSB.

From: MIKE DURKIN
Topic: 2228 Message: 2229

what ever your soundcard and sdr program can produce in an I/Q type system can be done ...

freq range of UHFSDR with a class A Si570 is 1.69Mhz to 512Mhz (and some what higher) ....

Lowpass filter on the UHFSDR is the limiting factor in BW for Rx / Tx -- 120Khz is enough for you?

packet radio is still limited to 3khz of bandwidth ....

G3RUH modulation could in theory be done in the software driving the UHFSDR, but you still need the client software that can communicate with the radio software. I don't know of too many applications that use TCP/IP to do that.

Hi,

Has anyone used the device from Henrick USB-zu-Parallel-Umsetzer https://www-user.tu-chemnitz.de/~heha/basteln/PC/USB2LPT/ with this?

My old PC WITH an LPT port finally bit the dust so got to sort out an alternative option when using with PC.

Hi Dom

Never heard of anyone using the Henrick adapter with a UHFSDR, but it gave good results interfacing computers with Scotty’s Modular Spectrum analyzer (MSA)

BTW, did you know that Dave WB6DHW has exactly the very same interface ?
http://wb6dhw.com/HSUSB.html
(but different firmware)
There is also a lot of CY7C68013A based boards made in China and sold on eBay (but many of them are selling “out of specs” components)

The “true parallel firmware” seems to be here
https://www-user.tu-chemnitz.de/~heha/basteln/PC/Programmiergeräte/DataIO%202700/#4
on Henrick’s website.

Depends on your OS ...
Linux is almost plug and play
Window requires a signed driver/DLL

Then what ever SDR I/Q program ....

There is a bit more to it when using the uhfsdr to get the correct frequency .... just a few commands sent to the AVR to change the set point device by's ...

Hello,

How are you. Plese ignore the previous question (regarding ax25 and ccsdc - it was a poor question). The client software we were intending to use was a highspeed soundmodem (U7ZHO). This software does can implement our modulation scheme (G3RUH). Based on my readings, it appears that it compatible with a Windows OS. Have you any experience with soundmodem? To interface with the UHFSDR, I believe we would need a USBI2C device. Also, have you heard of a device called USBSDR. I've also come across this during my serach to find of means of interfacing a Windows OS to a UHFSDR. Would you know the difference between the two.

Hope to hear from you soon,
Best,

you could use a Via1630/1620 (96khz @ 2 channel) based USB sound device to the UHFSDR or higher bit rate,

Any Si570 controller you want -- i use a QRP2000 ... there are others out there, or get your own AVR and program it yourself.

In order to use most SDR hardware and packet radio, you will need an intermediate program to reconstitute the I/Q audio streams into something that the packet radio can use --- and vice versa.

I use linux systems and an addition to the interface between the digital radio program and the SDR i/q radio program i use a audio linking FAKE soundcard -- called snd-aloop. Its not implemented in Linux kernel any more but can be built since its still in the kernel source code.

in windows i think there is a program used as well (virtual audio cable i think) -- paid.

Subject: [UHFSDR] Re: UHFSDR implementing G3RUH

Hello,

How are you. Plese ignore the previous question (regarding ax25 and ccsdc - it was a poor question). The client software we were intending to use was a highspeed soundmodem (U7ZHO). This software does can implement our modulation scheme (G3RUH). Based on my readings, it appears that it compatible with a Windows OS. Have you any experience with soundmodem? To interface with the UHFSDR, I believe we would need a USBI2C device. Also, have you heard of a device called USBSDR. I've also come across this during my serach to find of means of interfacing a Windows OS to a UHFSDR. Would you know the difference between the two.

Hope to hear from you soon,
Best,

Hi
VB Cable is a free Windows alternative to VAC (I use it with OpenHPSDR and my "audio board", FA66 or SDR-Widget)
http://vb-audio.pagesperso-orange.fr/Cable/
very efficient, compatible with 192kHz boards.
It works perfectly with SSTV or RTTY, Hellschreiber, PSK or JT decoding/encoding software.
I see no reason why Packet shouldn't work.

OZ7HO software could gives good results (But I must admit, I never played packet radio with any of my SDR)
http://uz7.ho.ua/packetradio.htm

Objet : Re: [UHFSDR] Re: UHFSDR implementing G3RUH

you could use a Via1630/1620 (96khz @ 2 channel) based USB sound device to the UHFSDR or higher bit rate,

Any Si570 controller you want -- i use a QRP2000 ... there are others out there, or get your own AVR and program it yourself.

In order to use most SDR hardware and packet radio, you will need an intermediate program to reconstitute the I/Q audio streams into something that the packet radio can use --- and vice versa.

I use linux systems and an addition to the interface between the digital radio program and the SDR i/q radio program i use a audio linking FAKE soundcard -- called snd-aloop. Its not implemented in Linux kernel any more but can be built since its still in the kernel source code.

in windows i think there is a program used as well (virtual audio cable i think) -- paid.

From: MIKE DURKIN
Topic: 2242 Message: 2242

I cant quite rap my head around this thought yet ....

When operating on a harmonic .. lets say iv got the uhfsdr set to 48.96Mhz and i'm Rx'ing a signal or Tx'ing a signal ... and i have a bandpass filter for 2M (144mhz --> 148mhz) ...

if the audio edge is lowest at +6Khz and has a bandwidth of 3khz ... making its bandwidth edges 6khz and 9khz ....

is the 3rd harmonic modulated signal now 9khz wide or is it still 3khz? ...

From: MIKE DURKIN
Topic: 2242 Message: 2243

Im going to guess its still 3khz wide because the modulating signal is mixed with the 49Mhz signal and also the 3rd harmonic of 146.88Mhz ...

The harmonic is present before the mixer, not made from the mixer ....

Is there also products from the mixing of the 48.96Mhz being added or subtracted to the 146.88Mhz signal ?

Topic: 2245 Message: 2245

Ok .. i now have Rx of VHF packet radio with my UHFSDR (sdr) running ubuntu14 and Quisk-4.1.1

I had to use another soundcard because i simply couldn't get Tx audio through the snd-aloop ....

Im using Linpac with Direwolf and about 3/4 of heard signals are decoded ... some are terribly distorted or i guess too week.

Thanks to those that helped .... ill still keep plugging along ... maybe i will eventually figure out why snd-loop is uni-directional on my Arm-v8.

Direwolf was set to plughw:3,0 -- hw:3,0 was not working for some reason .... but oh well ...

What the heck .. reading through some of the documentation for direwolf .. i came across enabling PTT through a CM-108 GPIO...

Are you kidding me ?!?!?!? how long was that done?

Wonder if it works on linux too .... lol !!!!!

Has any one here done this ?

its a DMK URI mod for a CM-108 !!!!

https://github.com/wb2osz/direwolf/blob/master/ptt.c

[https://avatars2.githubusercontent.com/u/6499991?v=3&s=400]<https://github.com/wb2osz/direwolf/blob/master/ptt.c>

direwolf/ptt.c at master · wb2osz/direwolf · GitHub<https://github.com/wb2osz/direwolf/blob/master/ptt.c>
github.com
direwolf - Dire Wolf is a software "soundcard" modem/TNC and APRS encoder/decoder. It can be used stand-alone to observe APRS traffic, as a digipeater, APRStt ...

From: MIKE DURKIN
Topic: 2262 Message: 2262

This question is for every one .. but mostly directed twards Dave WB6DHW.

Im wondering if its a good idea to use a diplexer to provide a load for the larger signal present after the Rf amp (before it?) when operating on a harmonic.

I wonder if there is any ill effects to/from U5 when its larger signal component is unloaded -- the fundamental -- and lets say your interested in transmitting the 5th harmonic which next stage presents a 50ohm load.

Mike:
Not a bad idea to provide a diplexer after the amp. I think it would depend on if you have a band pass filter ahead of the amp and how good it is.

Topic: 2262 Message: 2264

I have vhf/ufh bandpass filters that are better than 50db (most are better than 60db, but 1.25m was only 52db) out of band rejection. ...

But I'm thinking of using those as part diplexer / part Normal operation BPF depending if I'm operating on a harmonic or not .... some UHF/SHF bands are harmonics of lower bands ... others are not ..

When operating on a harmonic, the vhf bandpass gets a load and harmonic gets amplified/filtered too ...

I'm just wondering if the fundemental should be filtered off to a load. I think the reason most do not see 50mW (close though) of fundemental power is because part of the power is being developed on the harmonics -- meaning that maybe , when using harmonics for TX ... the fundemental should be striped off first before the first amp (to get more power and perhaps less garbage).

I'm not sure what level of 0IF is being sent to the mixers --- maybe it makes no diference because you can't hit the mixers much harder ....

I'm still wondering if the unloaded fundemental might cause some non-linear products in the 3rd/5th ....

If it's fine, then I guess using filters after the Tx/Rx switch before the next RF amp stage will do.

I don't have a spectrum analyzer to check with / see ....

To: Dave dave@wb6dhw.com [UHFSDR]

Mike:
Not a bad idea to provide a diplexer after the amp. I think it would depend on if you have a band pass filter ahead of the amp and how good it is.

This question is for every one .. but mostly directed twards Dave WB6DHW.

Im wondering if its a good idea to use a diplexer to provide a load for the larger signal present after the Rf amp (before it?) when operating on a harmonic.

I wonder if there is any ill effects to/from U5 when its larger signal component is unloaded -- the fundamental -- and lets say your interested in transmitting the 5th harmonic which next stage presents a 50ohm load.

This might be a silly question ...

Why is a adt1-1 used on the input to the filter board and not on the output ?

How much current does the pin5 pull of the 2.5V U2?

Where does the 2.5v come from on the adt1-1/U1 ?

Don't remember why. The transformer on the input was designed to
connect to an antenna. The output would go to either a mixer or a preamp.

>

Mike:
Depends on the frequency. Looking at the 2 data sheets, the conversion loss is close for both. The ADE-42H is not specified below 5 MHz on both the RF and IF ports. The IF port on the ADE-2 goes down to DC. Could affect direct conversion to and from audio. Hard for me to tell from the schematics of the 2 devices. No capacitors in either. The ADE-42H has more diodes. Looks to me like the IF on the ADE-42H is DC coupled like the ADE-2. The RF input low frequency will depend on the core of the transformers and very possibly would have much more conversion loss than the ADE-2. If you have a ADE-42H, try it and let us know.

I have a UHFSDR system with an SI570 that failed a couple of months ago.

At this point I've forgotten the specs for the device.

What do I enter into the following table to get 1 or 2 replacements?

Frequency A:
MHz

Frequency B:
MHz

Frequency C:
MHz

Frequency D:
MHz

I2C Address
hex format

- THANKS -

From: Dave
Topic: 2280 Message: 2283

I only saw 1 block for frequency entry, although it is a drop down. For the frequency, select 10-945 MHz, etc. For the I2C address, select the default of 0x55. For the output select the default LVECL. For the startup frequency, you can put in anything. Put in 2 X what you would like your UHFSDR to to start at (I put in 19.982 MHz so the center freq is 9 KHz from WWV at 10 MHz).

After struggling with this for more time than I care to admit :-^(I finally realized that I wasn't logged in to the SILABS website....

I started over. Made sure I was properly logged in this time and was greeted with a page that insisted that I change my password. Then FINALLY was able to click on the link provided in your message and everything pretty much defaulted to a usable part.

I did some fine tuning (start up freq / stability option) then it was off to the ordering page.

Two are now on the way.

A great big

!!! THANK YOU !!!

Thank SiLabs! Helps me sell more UHFSDR boards. Sometimes like now you can get them free, sometimes not. I was curious and started through the process to buy the Si570 from their site. They have a min quantity of 50 at $47 each! I actually got 2 free with address of 55H and 2 free with address of 56H. I will use these on a superhet rig with one for LO and one for BFO.

Silicon Labs is again sending free samples of the Si570. I just ordered
2 grade A LVECL output Si570's. Configure the Si570 at

<https://www.silabs.com/products/clocksoscillators/pages/oscillator-part-configure.aspx?PartNumber=Si570>

I think you need to register on the site for things to go through.
Takes about 2 weeks.

Hmmm,

Must be US addresses only. I tried, but when I got to the relevant step, Order Samples was greyed out & not able to be clicked.

But thanks for the heads up anyway.

>>> I only saw 1 block for frequency entry, although it is a drop down. For the frequency, select 10-945 MHz, etc. For the I2C address, select the default of 0x55. For the output select the default LVECL. For the startup frequency, you can put in anything. Put in 2 X what you would like your UHFSDR to to start at (I put in 19.982 MHz so the center freq is 9 KHz from WWV at 10 MHz).

<<<

Hello,

Can you please help configure samples. With frequency and HEX address is clear, but there is more options:
- Supply Voltage (can assume 3.3V)
- OE Polarity (no ideas)
- Stability (61.5 ppm is better then 20 ppm ?)

Thank you for info in advance.

Regards,
Andy - YL2QN

2293. UHFSDR microwave operation

Yahoo group: UHFSDR
Date: 2016-12-14 22:45:54 UTC
From: MIKE DURKIN
Topic: 2293 Message: 2293

I'll start off by saying that i don't know what the useful top end for the Si570/UHFSDR with a Class A si570 ....

But i have managed to push the UHFSDR to 3.5Ghz by using the 5th harmonic .... 707Mhz X5 = fun.

I run Ubuntu 14.04 and Quisk 4.1.2

I use a Qrp2000 (PE0FKO) Si570 controller .... and i changed the band multiplier to 2.

I got this script from Sid Boyce -- hope he still gets emails from UHFSDR

```
#!/bin/sh
usbsoftrock set si570_multiplier 0 2
usbsoftrock set si570_multiplier 1 2
usbsoftrock set si570_multiplier 2 2
usbsoftrock set si570_multiplier 3 2
usbsoftrock set si570_multiplier 4 2
usbsoftrock set si570_multiplier 5 2
usbsoftrock set si570_multiplier 6 2
usbsoftrock set si570_multiplier 7 2
usbsoftrock set si570_multiplier 8 2
```

So then i copy'd hardware_usb.py and called the copy hardware_usb_5th.py

Changed a few lines and remarked out 2 --

Ill post the hardware file to the files section later ... i need to get my kids .. like right now, so i cant finish this .. sorry.

Basically set quisk to direct control, changed the freq multiplier to 1 (in hardware_usb.py -- was 4 for softrock)

Topic: 2280 Message: 2301

All,

I placed a request for two samples (just like many did here). I was contacted by the local rep yesterday regarding the samples and was quizzed on my "product" and what I needed them for. I asked about the samples and was told they were "very expensive" and they would submit the request for me, but were not likely to get the samples request approved. This is very different from the last time I tried to get samples (over five years ago). I think the amateur community might have overwhelmed them with freebie requests and this time around they are trying to sort out the ones looking for free samples for projects vs. product development. In my case, I have an electronics company and I do often request samples for product development. I had to sort of take that angle with the rep, hoping it might work in my favor to get them. At this point, I would be happy with just one to build my UHFSDR kit.

I'm just curious if anyone else was contacted the same way after they submitted for their samples. Has anyone received theirs yet? The rep told me that once you submit a request, it's fielded to the local rep to you and they take it from there. Not sure if they are trying to cut down on the expense of giving them away to "non-legitimate" customers or if they are using this as a marketing technique to sell you more parts.

Mike:
No additional. But, there is room on the board for a filter or an amp stage. Don't recall if it was you or someone else that used the UHFSDR on 3 GHz by using the 5th harmonic of the LO. There is also a jack for using an external LO. Also, Minicircuits has several other mixers that are the same footprint as the ADE-2ADK.

Mike:
No change on the mixer. A higher frequency(at the expense of the low end) from Minicircuits Labs with the same footprint will work. I think the high frequency limit is the WBC2-1TL transformer on the mixer RF inputs. The data sheet shows it to be 5 dB down at 900 MHz.
It will be some time before I have new boards made as I still have about 30 boards left.

I remember replacing the WBC2-1TL with something else from mini-circuts ... don't remember what it was now..... I really need to take better notes, but it didn't make any difference on the low end. It didn't fit the foot print and I had removed the transformer from its plastic case ....

Bob:
No recent changes to the PCB. The latest revision is R2. But, the PCB says R1a. I am working on changes for the next run. I am planning on including the Tiny88 USB interface on the board.

Yes. The USB2SDR contains a Tiny85. The new board will contain the same.

Mike

I assume you meant SPF-5043Z, as SPF-50432 doesn’t seem to exist in the now defunct RFMD catalog.
RFMD was acquired by Triquint, and a lot of good things from RFMD have now disappeared.

Just curious,

Probably ....

I was using my phone then and I'm using my phone now and I just simply copied and pasted out of another email I made a while ago ....

I'm not entirely sure what I'm overloading right now. It's only seen on two Local 2 meter repeaters and both of them are relatively close to me. It's either u4 or the opamp.

2326. SDR4NET, A New SDR Project

Yahoo group: UHFSDR
Date: 2017-02-04 12:40:32 UTC
From: sv1eia@...
Topic: 2326 Message: 2326

Dear fellow radio amateurs and homebrew SDR enthousiasts,

A New SDR Project campaign has just launched !

-> https://igg.me/at/sdr4net https://igg.me/at/sdr4net

Let me address this announcement to all of you, either having a homebrew/DIY SDR or considering to move into the wonderful new world of Software Defined Radio.

A project that will provide to SDR users a specifically designed device for the needs of homebrew SDRs and also of other commercial rigs like KX3 (we are working also on a SDR1K version via an add-on).
With ease of setup and operating right out of the box in a networking environment.

Its a project that will allow any owner of Ensemble RxTx, UHFSDR, Lima-SDR, FA-SDR, or any equivalent homebrew SDR based on IQ input/output, to have proper operation, by providing a dedicated SDR ADC/DAC device designed for radio amateur use.

Special effort has been given for the owners of KX3 who now will have the ability to work seamlessly with PowerSDR when connected.

All users can now have the opportunity to get the benefits of hassle-free operation in all new Windows verisons 8/10, plus the ability to experiment in Linux and Android with their rig, and all those benefits come with the high-end dynamic range of AK5394A ADC.

The solution relies on ethernet networking and with its driverless setup makes users free from driver installation and configuration issues.

For those who would like more information, here is the inital campaign announcement on the powersdr-iq support group

-> https://groups.yahoo.com/neo/groups/powersdr-iq/conversations/messages/3298
https://groups.yahoo.com/neo/groups/powersdr-iq/conversations/messages/3298

Best regards & 73,

Christos SV1EIA

roseengineering has 20 repositories available. Follow their code on GitHub.

I cant find any information on the owner .... im hoping to get them to update the rtlsdr for quisk plugin ...

2329. Si570 cannot change frequency

Yahoo group: UHFSDR
Date: 2017-05-05 18:03:36 UTC
From: Marc.olanie@...
Topic: 2329 Message: 2329

Hi
I've a strange behavior on a UHFSDR

- Si570 AAA000112G (LVPECL) has been changed 3 times with a brand new component
- Adum has been changed, checked and is working
- a I2C query gives me the address of the oscillator in 055 (meaning the Si570 responds correctly to I2C)
- Vdd is 3.29V
- F output is 10 MHz, default starting frequency. Both outputs are OK (out of phase one to the other, clean square signal)
- signal is approximately 0.5V peak
- the I2C controler works perfectly with any other Si570 based rig (several Softrock, another UHFSDR with a Cmos Si570...)
- I2C cables are as short as possible
- components have been checked several times
- the rest of the UHFSDR is working as advertised... but on 5 MHz only
- OE -positive enable- shuts the output down when grounded... as expected
- SDA and SCL are clearly seen on my scope when I'm trying to change de frequency. Doing this makes the output "shivering" with a really strong jitter. But the signal stabilize as soon as I release the VFO encoder, and the frequency is blocked again on 10 MHz

all AAA XO's are SiLabs samples

Did someone had similar problems ? I must admit, I really don't understand what's happening

From: Marc OLANIE
Topic: 2329 Message: 2330

One more info
I just replaced the Si570 with Cmos component (CAC000141DG) coming from an old softrock… everything runs fine, frequency can be changed… it is definitely not an I2C problem or a microcontroller issue

From: Dave
Topic: 2329 Message: 2331

Hi Marc:
What are you using to control the board? Are the connections to H1.
Pin 1 is the Vdd from the controller and pin 2 is the ground from the
controller(NOT the same as the ground on the board - they are
isolated). Are R61 and R62 1K. You could try increasing them. Does
sound like an I2C problem. The Si570 will reset to the default value if
it doesn't understand the I2C command.

From: Marc OLANIE
Topic: 2329 Message: 2332

Hi Dave
Connections are on H1 (and H1 is correctly wired, as my Cmos Si570 accepts order and my I2C Scanner detect the XO)
Right now, I'm using a STM32-SDR to control the board, but I also tried a SDR-Widget and a personal hack with an Arduino. All of them are running without problem

I2C pull-up are 1K. I'll try to increase this tomorrow. LVPECL is probably less tolerant than Cmos.
I hope you've find the culprit… I'm working on this problem since Wednesday :- (

Thank you, Dave

It took me many months troubleshooting only to find that the 2 free samples from SiLabs and one spare donated by GI1CET were all DOA.

Eventually I got one from George Boudreau and my UHFSDR sprung into life.

I suspect that the free samples are not full functioning devices and depending on luck, they may or may not work.
73 ... Sid.

Marc,

I believe that SiLabs offers the Si570 with a fixed output frequency.
Could your samples be some of these?

Check the bypass capacitors(C45 and C46). Make sure they are connected to the Si570 supply pins and to the 3.3V. I am working on a front panel with a Si570 and had similar problems to yours. Found out I forgot to put in a bypass capacitor. When I added the capacitor, the problems went away.

Hi
No more tests today… I'm stuck and don't have other explanations than a series of dead Si570.

>I believe that SiLabs offers the Si570 with a fixed output frequency. Could your samples be some of these?

Hi Milt. Where did you got this info ? It's the first time I heard about that, but it could confirm my diagnostic. I really don't see why SiLabs would have such an attitude… but who knows

>It took me many months troubleshooting only to find that the 2 free samples from SiLabs and one spare donated by GI1CET were all DOA.

Hi Sid. I remember you message mentioning this possibility… was it 1 or 2 years ago ?. When you say "dead", was it really dead -no heartbeat at all :-) – or was it oscillating without responding to any I2C injunction ?

Dave got some of these samples too (in fact, I ask for my Si570 after his announcement on this mailing list). Where they all full functional ?
Dave, you asked :

>What are you using to control the board?
Right now, an STM32SDR, but I have the same behavior with other control boards.

* Are the connections to H1. Pin 1 is the Vdd from the controller and pin 2 is the ground from the controller(NOT the same as the ground on the board - they are isolated).

Yes Dave. I burned an ADUM 2 years ago when I forgot this cabling :- / … no error this side of the circuit. My Arduino-based I2C Scanner wouldn't show any dialog with the Si570 if H1 if I messed with H1

* Are R61 and R62 1K. You could try increasing them.

They are. I tried to increase to 3.3 k without any change

* Check the bypass capacitors(C45 and C46).

Checked and changed all decoupling caps… no reactions, Si570 still working on 10MHz. Noise on the 3.3 rail is really low

I'll change the Si570 with a lvds next month
Thanks to all of you for your help and support.
So far, I'm the happy owner of 4 dead Si570 AAA grade. I'm pretty sure it's a Guinness record

Marc:
I have not seen a dead Si570 from SiLabs. But, I have several I have not installed. I also have not heard of a fixed freq Si570. SiLabs does have some fixed freq devices based on the Si570, but with different part numbers(Si530, etc). But, the fixed freq devices do not have pins 7 and 8.

Did you get the 7ppm temperature tolerance parts? SiLabs changed
the registers on the 7 ppm parts. If the software does not take that
into account, then they would not program.

Hi Dave

That’s not impossible… I frankly don’t remember. But if you ask any ham to choose between a 7ppm and a 20 ppm part…

Thank you, Dave. It is the most logical explanation. I’ll look at these differences and try to write a piece of code (or patch an existing one)

:-))

Hi Dave
Config register should be 7-12 as my temp. stability is 61.5ppm (AAA and not ACA).

>Absolutely no output from the 3 free AAA samples.
>The fourth from George Boudreau which I think was a purchased item immediately worked.

Thanks Sid. In other words, my problem is different from yours as my Si570 gives a clear I2C answer when requesting it's address, and the chip oscillates at the starting frequency. I never had troubles with oscillators sold by George or The SilverFox

Back to my Arduino workbench...

Hello,
Run CFGSR , go to Calibrate Tab, Insert your start up frequency, Select Reset button. Go back to your UHFSDR. Switch on. Try now.

Si Labs would never send out faulty parts to anyone, I am sure.

Hi Ed
Computer=> CFGSDR=>SDR-Widget=>UHFSDR
Bingo !

It works at least from 3 MHz to 440 MHz (didn't check 1200/1400 segment, but it should do it's job)
Returning to former config and the Si570 won't go away from it's factory startup frequency

The culprit is the STM32-SDR, more exactly the mix of a LVPECL and STM32-SDR, as Cmos version of the component runs flawlessly. I've been confused by this coincidence.
Btw, I used the same MCU/UHFSDR cable in both cases

SiLabs would never send several parts with manufacturing defaults, I admit. But I could have destroyed the chip myself with a misconfiguration or any other Pebcac interference

Thank you for this bright idea. CFGSDR was the key

The Silabs website has drop down menus. Select the desired option in each menu. If you are getting the Si570 for the UHFSDR, the circuit resisters are set for the LVPECL output option. n LVDS would require several resisters to be changed ads noted on the schematic. Part number 57 0AAA0001528DG will give you a class A(up to 1.4 GHz) LVPECL interface with a startup freq of 19.984 MHz.

2349. 9912 board

Yahoo group: UHFSDR
Date: 2017-11-16 23:06:04 UTC
From: Dave
Topic: 2349 Message: 2349

Several years ago I designed and sold an AD9912 board. But, it moved slow and being 4 layer was expensive. I recently found a board house that I can get 10 at a time for a reasonable price. If a couple of people are interested, I will order a batch. The last batch of 100 I ordered lasted about 5 years!

The AD9912 board contains an AD9912 14 Bit, 1 GHz DDS plus the clock circuit and a PIC controller chip. The board is designed to be controlled via USB from a PC. But, one customer did write some firmware for the PIC and a circuit to use the board as a stand alone generator. When I designed the board, the AD9912 was new and Analog Devices was handing them out for free. They now are around $60 each.

Jim:
  It is not BGA. The AD9912 is a 64 lead Lead Frame Chip Scale Package. The leads wrap around the bottom edge and are .5mm center to center. I was able to solder it. Not easy, but doable. I solder opposite ends down and made sure all pins were aligned. Then run a bead of solder down the side. Then suck the solder off with solder wick.

I'm interested in getting a board as well. But, I'm curious about your success with soldering the AD9912. The datasheet shows a LFCSP_VQ 64 pin package with a E-pad that provides analog ground. Usually connection of these e-pads are also necessary for problem thermal dissipation as well as providing the analog ground.

Does the PCB provide the E-Pad correct connection so that could use paste and a toaster oven or hot plate for soldering the epad?

Jim:
  The board has the E-Pad. It has 4 vias along the outside and a plated thru hole in the middle that you cn solder vrom the back with a very fine soldering iron tip. The solder paste and oven works also. Just don't put too much on the E-Pad.

Hi Dave,

That sounds great, I've never soldered an E-pad directly that way, but I have seen that done quite a bit for lower volume boards.

On your board, did you take any spectral plots of the output waveform? Were there any spurs, and what was the close in noise performance?

Please add me to your list if you haven't already done so!

2363. Pi SDR Interfaces, New Site and Campaign

Yahoo group: UHFSDR
Date: 2017-11-27 09:52:50 UTC
From: sv1eia@...
Topic: 2363 Message: 2363

Hi All,

For the Pi SDR new interfaces, a dedicated site has been established. Please let me announce to you the new Pi SDR site

-> https://pi-sdr.com https://pi-sdr.com

In here you can find information for Pi SDR IQ and IQ Plus.

Great news for Flex SDR1000 users, as now they can have a new solution tailor-made for SDR1000 to re-vitalize their rig and work in modern PC and new Windows versions. That solution comes with a dedicated included LPT control interface. More detailed information is in the https://pi-sdr.com https://pi-sdr.com pages.

For those who have homebrew Ensemble/Softrock type of rigs, a cost benfit solution as the Pi SDR IQ is there for them or even the Pi SDR IQ Plus with enhanced performance.

The new campaign is available here

-> https://igg.me/at/pisdriq https://igg.me/at/pisdriq

Anyone interested can contact me for details.

Best regards & 73,
Christos SV1EIA

Sorry Mike,

I should have included Christos' announcement for Pi SDR.? He has two interesting daughterboards for processing the I/Q of SDRs like the Softrock or SDR-1000.? I was impressed that the A/D must work down to DC, as I saw no spike for DC and the image rejection looked really good on the photos on his site.? I wanted to investigate that, but didn't see any schematics or software. Therefore, I asked Christos about that.

Hi Mike
Here is the original post if you missed it in email, the links to both the new site with details and the campaign if you are interested.

Hi All,

For the Pi SDR new interfaces, a dedicated site has been established. Please let me announce to you the new Pi SDR site

-> https://pi-sdr.com https://pi-sdr.com

In here you can find information for Pi SDR IQ and IQ Plus.

Great news for Flex SDR1000 users, as now they can have a new solution tailor-made for SDR1000 to re-vitalize their rig and work in modern PC and new Windows versions. That solution comes with a dedicated included LPT control interface. More detailed information is in the https://pi-sdr.com https://pi-sdr.com pages.

For those who have homebrew Ensemble/Softrock type of rigs, a cost benfit solution as the Pi SDR IQ is there for them or even the Pi SDR IQ Plus with enhanced performance.

The new campaign is available here

-> https://igg.me/at/pisdriq https://igg.me/at/pisdriq

Anyone interested can contact me for details.

Best regards & 73,
Christos SV1EIA

Hello Rob,

In the meantime, why not ask Christos to release the source code for his version of Flex 2.4.4. many years after the application was made public.

It is interesting that there are very strict rules for the use of software under the GPL licence.

Please check out the licence of the Flex software.

One of the aspects is that whenever the application is made public then the source code must be released at that time as well. Otherwise there is a serious violation of the terms of the licence.

I recently contacted Flex and requested the source code for one of their software versions. The Flex company responded within two working days and issued the source code requested.

The Flex company most definitely kept in compliance of the GPL software license , they, after all, realise that it is not their code, it is code that has been designed and enhanced by the many individuals throughout the world who have contributed over the years.

Certainly I was very grateful of them in releasing the source code so promptly when requested.

They are a very honorable group to do business with.

Rob, why not have a look at a few of the well known SDR Software applications available at this time. Yes , a few of the first that come to mind ! Then check the licence terms then ask yourself has there been violation of the licence by the individuals who are releasing the Software. You may be surprised with the result.

Good luck.

Regards
Ed GM3SBC

Hi Ed,

PowerSDR-IQ 2.4.4 executable is exactly what Flexradio is releasing, there are no differences.
Everybody interested knows that in there there is only one external .dll program, SDR1KUSB.dll that is additional.

Flexradio never released any portion of that external .dll code themselves whenever they are asked, my guess is that they have not given that to you.

Got no issue on releasing the aforementioned .dll source that I developed and delivered for free to everyone using Softrocks/Ensemble or UHFSDRs.
Although it is not labeled as opensource itself from what I know.

73,
Christos SV1EIA

2383. UHFSDR transmit control from USB

Yahoo group: UHFSDR
Date: 2017-12-07 14:45:34 UTC
From: wr3ichgaxgujzxc4xrtrdpsyfntna4dk62d2hiuq@...
Topic: 2383 Message: 2383

I have figured out how to reliably key the UHFSDR from USB2I2C (and HDSDR).

It seems that the PTT pin does not reference a good ground- although I had some intermittent success when audio cables were plugged into the PC sound card.

The PTT pin on the ATTiny does not have a reliable ground reference, since the ADM isolation chip separates the USB ground and the radio ground.

My solution was to use a low level optoisolator keying circuit and 5V micro (low power) relay, powered from the USB side (the radio interface header has USB +V and ground on pins 1 and 2).

The 5V relay SPDT contacts control the T/R by P2 pin 1 0V (RX) or +5V (TX). I also use the switched +5V to control a T/R relay on the antenna.

This method retains isolation of the Vcc and grounds but allows T/R control with just the USB connected.

I have used the CW key hookup in the past with softrocks, HDSDR won't support CW directly- the DLL does not pass back to the program. Rocky used to, have not tried it on the UHFSDR.

I used an old USB keyboard and hooked an external keyer to the return key, used that to send CW with HDSDR, but it falls apart at 15 WPM, USB can't get back fast enough, since keyboards and mice are polled in Windows.

The Peaberry got around this by developing their own CW program- which works perfectly- but only with Peaberry V2 hardware.

So long story short, the return key works for slow CW.

Topic: 2383 Message: 2387

OK. Open HDSDR and configure for Softrock. open CfgSdr or do it from hdsdr screen (EXTio.dll)

In SI570 tab, find the multiplier and change it from X4 to X2
Disable the ABPF (bandpass)
I used Ensemble RxTX as the radio type.

Save, change the SI570 startup frequency if needed, then save again.

I have found that you need to make one frequency change (up or down, any amount) to get HDSDR to sync with the SI570.

Transmit support is necessary to get HDSDR to work as a Xcvr. That means a 2nd sound card. Dont attempt ASIO, that only works for receive.

This is all from memory but pretty close.

Get the latest CFGSDR and HDSDR and they will work on W7, W10.

2389. 8 band pass filter

Yahoo group: UHFSDR
Date: 2017-12-19 01:32:31 UTC
From: MIKE DURKIN
Topic: 2389 Message: 2389

Hey I want to use my 8 bandpass filter that I never actually hooked up I would like to put it into an atlas radio and I would like to since it has its own band switch I'd like to wire it straight to each bandpass section without using the switching IC's.

Is there a diagram showing where each band is at?

2390. Quisk

Yahoo group: UHFSDR
Date: 2017-12-20 01:21:53 UTC
From: wr3ichgaxgujzxc4xrtrdpsyfntna4dk62d2hiuq@...
Topic: 2390 Message: 2390

I've given up on HDSDR and moved to Quisk. I have it communicating, but the division ratio seems to be wrong- 100 Mhz FM transmit is outputting 200. And getting very confused as to where the division ratio is set. Cfgsdr says its correct at 2.

Anyone with quisk running?

Using 4.1.12.

I found the script from Sid Boyce via KC7NOA that uses usbsoftrock to change the multiplier to 2. I also modified the settings to SI570 direct control=False.

It holds through reboots, and seems to be on frequency after a calibration using usbsoftrock.

Ubuntu Mate, Quisk 4.1.12, Startech (VIA) USB sound card, builtin sound card for speaker and Mic.
On an Intel Atom 1.6 GHz 1 GB ram, 60 GB SSD single board computer (thinterm style)

Now getting 3.2V PtP into 50 Ohms at 144 mHz transmit.

Harmonic reduction is the next step.

Touchy little critters. I've damaged or blown 2 of the darn things. One open circut, and 1 from what seems to be a ratty bench supply. RadioShack switcher 13.6V 15A, and things were great until I connected to it instead of the 12V linear China special.

Mouser still has 10 HMC 482 but both it and the sub are discontinued. I bought 5 and glad I did. Went from oscillations whenever power applied to a real radio transmitter by replacing that part again. Cleanish with 2nd harmonic -30, 3rd -15. BPF for 144 Mhz is incoming. Its for an IF rig as part of a 1296 radio.

Has anyone else had this kind of fragie behavior?

From: Hans
Topic: 2397 Message: 2397

I am working on using an external oscillator input via the SMA connector and transformer.

Using twisted pair to do the interconnections between the test points. Will 100 ohm twisted pair from cat5e cable be fine?

Are the resistors R46,R47,R48,R49 used?

What value do I use for R45?

Do I use capacitors for C59 and C60?

2398. Re: [UHFSDR] External LO

2399. External LO

Yahoo group: UHFSDR
Date: 2018-01-10 10:02:22 UTC
From: Hans
Topic: 2397 Message: 2399

The idea is to use the external Oscillator Connection (J5)
looking at UHF_SDR2.sch
J5 goes to T2 (TC1-1-13M), TP6 connects to TP9 and TP7 connects to TP8,
The words 'Twisted Pair' are next to TP7
On page 6, I am not sure of the values to use.
The impedance range or construction isn't shown.
The circuit diagram has
LVDS Si570:
Use values shown

and

PECL Si570:
R45 = OPEN
R46, R48 = 82
R47, R49 = 130
C59, C60 = 0 ohm

The circuit has no information that I have seen on what to use for 50 ohm transformer input.
I am wondering if R45 would need to be 50 ohms?

in http://wb6dhw.com/UHF-SDR/UHF_SDR%20Assembly%20Manual-with%20SV1OBT%20suggestions.doc
I don't see information for constructing using an external LO, except to skip a section.

Topic: 2397 Message: 2400

Hans:
? Connect TP6 to TP9 and TP7 to TP8.? Twist the two wires together to form a twisted pair.
R45 should be open.? R46 and R48 are 82 ohm.? R47 and R49 are 130 ohm.?
C59 and C60 are capacitors - ceramic .001 to .1uFd.

Hi Guys,
The best way to get these parts is to order them from Silicon Labs. Yes, buy them !
After all, once you have received a free sample of their parts, as you have done in the past, you know what they can do. Thereafter if you need more it is best that you order them. Please do not abuse their service.
You will destroy it for others.
When I request samples on a professional basis, I do a comprehensive test of the parts.
Then I decide if the parts are suitable for my appilication.
Thereafter, I do the honorable thing and purchase their product.

Support these companies !

Please do not be freeloaders!

I shall be placing orders to many thousands of dollars to Si Labs. I can only hope that you will do the same and support them.

Regards
Ed Murphy

Mike:
? If you customize a device on their website, you just select LVDS from the drip down menu.? The first digit after the Si570 will be a B for 3.3V LVDS and High output enable.? The next letter is the stability.? The 3rd letter is the speed grade(A, B, or C).? The digits after the three letters depend on your startup frequency.
? Your other Si570 may not be dead.? When working on a front panel which has 2 Si570's(different I2C addresses), I left off the supply bypass cap.? The I2C sequence locked up the nano and kept the Si570 output off.? Last night, I had the same problem because I had a 16 bit I2C expander that didn't have a supply bypass very near it.? I added a 0.1 cap near the supply pins and the Si570 now works as advertised.? Note, I was careful to include the 0.1 uF bypass near the Si570 supply pins on the UHFSDR.

  I forgot to mention, the 7ppm version uses a different set of registers for the programming, so requires the latest control program.

Dave,

I have a Si570 (AAAOOO1126) and would like to control it from an Arduino Nano. Can you please point me
to a sketch which would be suitable.

Mike:
I just tried to order a sample for Silabs. The button to order a sample seems active, but doesn't do anything. Never went to the cart. I was able to order a sample of a Si5341A and it went to the cart. i did get the email with the created part number for the Si570 and a link to order a sample from their reps.

2418. Si 570 Ultra High Stability Product.

Yahoo group: UHFSDR
Date: 2018-02-21 16:14:37 UTC
From: ed.murphy31@...
Topic: 2418 Message: 2418

Hello Mike,

A heads up !

You may be interested in a new product that we shall be introducing soon which shall provide the capability of Ultra High Stability of the Si 570, even in very harsh thermal environments.

This product has been specifically designed for the Si 570. It is a computer controlled frequency stabilizer the size of a postage stamp.

Probably for the very first time, the Si 570 with its very fine Frequency Resolution capability, can now provide a typical Frequency Stability of 0.012 ppm. . . . . .That is not a misprint: 0.012 ppm ! and we hope to have further improvement beyond this level.

The above stability performance is currently being demonstrated using Grade 'B' Si 570 parts under a harsh thermal environment while operating with RX / TX sequencing and applying a power delta of 40 Watts dissipation within the main equipment enclosure.

The product has been designed with the UHFSDR and many other current projects in mind. It can be quickly fitted to the UHFSDR PCB via a supplied micro miniature Interface PCB.

This project has been active for over 8 months and we are now at the Qualification testing stage.

The product announcement shall be made soon where cost and availability shall be listed.

Mike, should you or any others here be interested in the product, we would very much appreciate if they could register their interest by contacting myself by email via QRZ.com or . . . . (preferred) >>. . . . www(dot)scottie-sdr(dot)co(dot)uk http://www.scottie-sdr.co.uk

This would be most helpful in sizing our first production batch of units and also potentially allow us to reduce costs.

Digital Modes, now at a whole new performance level ! along with excellent CW and SSB.

Best Regards

Ed Murphy (GM3SBC)
on behalf of The Scottie Team.

Subject: Imbalance

Is there anyway I can get replacement parts from the flip flops to the balance mixers maybe even the balance mixers I have an imbalance that I would like to try to balance out the si570 carrier. I'm wondering if one of my parts is out of tolerance or something

Mike:
? I do have the flip flops and the DBM's.? How much imbalance?? A problem in a flop flop or in a DBM would likely cause one channel not to be there. But, the loss in one DBM could be higher than the other DBM. If you have a scope, you can check that the LO signals are 90 degrees apart.? If the imbalance is smaller, the audio amp gain in one channel could be different than the other channel.

I want to reduce/eliminate an imbalance in dbm or part values. I'm not really sure that the resistors can be checked on board.
